In the evening, when the bar-room was full of men, some one would inquire for "Topsy," and Peter would bawl until he made his appearance.

"What d' ye mane niglictin' the business?" Runians would demand, in a voice of thunder, when the little face was on a level with the counter. Come here!" and he would suddenly dive over the counter and lift the boy onto his shoulder. Then "Topsy" would sing songs for the company—simple old sentimental ditties taught him by Mrs. Runians, which sounded very strange in such a place—or he would repeat some of his "larnin'," as old Peter phrased it to a strange gentleman. Peter had been in his younger days the skipper of a collier sailing between London and Newcastle, and his language was full of those coarse and vain repetitions usual with men whose vocabulary contains no adjectives except oaths. But for all his gruff voice and coarse speech, old Peter Runians was one of the kindliest and most charitable men in the whole Province of Quebec. He and his wife Becky were childless, and they loved the little cripple, each after his own fashion, as a son.

"Topsy's" father had been a cobbler in St. Barthelemi—a drunken ne'er-do-well, whose quarrelsome temper lost him all his custom, and reduced him to the greatest straits of poverty. Mr. Joseph Joselin had not been seen or heard of in St. Barthelemi since the birth of his boy. He had suddenly disappeared, leaving his sick wife and infant child to face the world friendless and penniless. The mother died soon afterwards in destitution, with but one regret, that her poor babe still lived, and that she had to breast the shadowy tide of death alone. It was just about this time that Peter Runians became the host at the Revere House, and he heard of Mrs. Joselin's death.

One winter's evening he walked into his wife's kitchen, stamping the snow from out the chinks of his big felt overshoes, and making great puddles on the spotless white floor wherever he stepped. He had on his fur cap, encrusted with snow and ice, and his overcoat bulged out so that he could not button it across. He went straight to the stove, the door of which was open, and shook himself in the red glare as he pulled the icicles out of his great brown beard. Mrs. Runians was making piecrust, with her sleeves rolled up to her elbows, and she looked up in surprise, and, for once, with a little displeasure. Her husband was seldom seen in her especial domain, but such an entrance was quite unprecedented.

"Why, what's the matter, Peter?" she asked, pounding away at the dough on the table before her, in order to relieve her feelings.

Peter laughed, and threw open his great coat.

"This is about the biggest surprise ye iver had in yer life, I guess, Becky. I've got a little prisint for ye," and he strode across the room and put little John Joselin into her floury arms. The child opened its eyes at the moment of the transfer and looked up into Mrs. Runian's bewildered face, and then began to whimper.

"Well, 'pon my word, Peter—"

"There, there, Becky, hush the babe! The mither's gone, and he's a bright brat—like his poor mither. Take him up-stairs and put him in our bed. It's mighty cold out-doors to-night—twenty below, or I'm a Dutchman"—and he stretched his hands to the grateful warmth of the crackling pine logs.

"I never heard of such a thing in all my born days!" said Mrs. Runians, with the instinctive conservatism of a woman. "You are—" Peter put his arms round her waist and stopped her with a kiss. It was a rare exhibition of tenderness for him, and as an argument it was infallible.

"We're a pair of fools, Becky! that's what your father said when we married—d'ye remimber?—but, to my thinking, we get more out of our foolishness than the wise folk know of.

"There y' are with your blarneying and spooning, Peter," said Mrs. Runians, flushing with pleasure, and she turned and took the child up-stairs without another word.

The child cried a little at finding himself amid strange surroundings—the big, old-fashioned bed, with its heavy curtains, frightened him—but Mrs. Runians fondled him to sleep against her bosom. When she returned to her kitchen she found her husband still standing with his back to the fire, looking unusually thoughtful. There was something of the fussy air of a young matron about her, too, which made her eyes brighter than ordinarily. She went to him and laid her hand on his arm.

"Ah, if we had but a bairn of our own, dear, I should—"

"Tush, Becky, we'll make the boy our own! You'll be more than a mither to him, I know—I'm only afraid you'll spile him."

"And you?" laughing.

"Oh, I'll bring him up quite kerreck. You don't know me, Becky: I'm a stern man with childer; it does 'em good."

There was nothing more said about the matter. Peter Runians and his wife, in their connubial felicity, were a refutation of the popular superstition that a childless couple are bound to be always quarrelling. They never had any serious differences, and as for arguments, all their pet prejudices were held in common, and their desires were so simple that they never demanded any considerable concession on either side. During their long married life they had learned to think alike on most things.

And so "Topsy" grew up to regard old Peter Runians and his wife as his parents, and Mrs. Runians loved him as mothers love an only child, and as mothers alone know how to love.

As a rule St. Barthelemi was one of the dullest little villages along the St. Lawrence, if, indeed, it had not the honor of being superlatively ahead of all competitors in this particular.

But at last something happened at St. Barthelemi, and for weeks the tension of excitement was almost unbearable. That something had really happened—and something of real interest and importance—was sufficiently attested by the presence of a dozen newspaper reporters at the Revere House. They all arrived on the last train one night from Montreal, like a fall of snow, silently, and without warning, and the next morning St. Barthelemi saw itself in print. The fact of the village having a local occurrence of consequence completely paralyzed such industries as was indigenous to it and the immediate vicinity. The boarders at the hotel were surrounded by the reporters, and became condescending and important. Every one in the house devoured his or her meals with bated breath, as if every moment not spent in congregating round the big, dome-shaped stove in animated discussion of the event, and the probabilities of—but that is irrelevant—was an insult to time.

(*Concluded next week.*)

ELECTRICAL EQUIVALENTS.

THE DIRECT CONVERSION OF HEAT INTO ELECTRICITY.

In the annual report of the Berlin Academy of Science for 1891 appears a paper on the subject named in our heading, by Dr. R. J. Gulcher, of which the following is an abstract: That electric currents can be developed by the direct application of heat to the junction of two different metals, which is the fundamental principle of the thermopile, was discovered by Seebeck in the year 1823. As regards the theory of the subject, Clausius suggested in 1880 that "by the molecular motion, which is termed heat, electricity is driven from one material to the other;" and Kohlrausch's theory of 1875 is somewhat similar in assuming that the electric current is in some way connected with the flow of heat, and *vice versa*. The discoveries of later years, culminating in the researches of Hertz, prove, however, that the electric current is merely the result of a certain vibratory motion of the luminiferous ether, and, therefore, in accordance with the principles of the conservation of energy, a certain definite quantity of electricity without either loss or gain of energy, and it is this meaning that is given to the subject of this paper, conversion by a dynamo machine being termed "indirect." Proceeding then to calculate the absolute efficiency of the ordinary means of producing the electric current by a steam-driven dynamo, the electric energy developed is shown to be only 6.4 per cent of the energy existing in the coal burnt in the boiler; but even this low efficiency is eighteen times greater than the direct conversion of heat into electricity as furnished by a Noe and Clamond thermo-battery, where the efficiency works out at only 0.35 per cent. of the mechanical equivalent of the gas burnt. If the high efficiency of the dynamo and steam engine in themselves, as manufactured at the present day, be considered, it is clear that not much greater results can be expected in that direction, and the author has for some years been experimenting in other directions, therefore, for the direct conversion of heat into electricity. The principal idea acted on at first was the heating of a certain metallic salt in a platinum crucible, which should form the positive pole of the element, and a carbon rod immersed in the molten substance, the negative pole; this substance would part with its oxygen to the carbon, and then be reoxidized by contact with the air; and with this form of apparatus, a mixture of caustic soda and carbonate gave an electro-motive force varying between 0.475 and 0.4 volt, the "sodium blast" generated at the carbon point burning at the surface with its characteristic yellow flame, accompanied with slight explosions. For the similar potash salts the electro motive force was between 0.4 and 0.31 volt, the flame being violet and the burning more violent, and forming a small display of fireworks. The adoption of lead oxide resulted in a momentary high electromotive force, and then a sudden collapse of the platimum crucible, owing to the metallic lead reduced falling to the bottom and eating through the platinum. The author was surprised also to find that at the junction of the platinum connection wire the crucible was also severely pitted, as the current had never been short-circuited, and he has no valid explanation to offer therefor. After these experiments, the results of which did not promise any simple solution of the problem, the author set himself to improve, if possible, the thermo battery, and for which purpose attention was directed to the following particulars: 1. The adoption of durable materials. 2. That the electro-motive force and specific conductivity should be as high as possible. 3. Improvements in the form of the element. 4. Improvements in the application of the heat, *i. e.*, a higher efficiency in the production of the heat itself. Subsulphide of copper, in spite of its high electro-motive force, gave, on account of high specific resistance, a weaker current than materials which gave only half its electro-motive force, and it was also found that, by a species of dry electrolysis, granules of metallic copper were formed throughout the body of the material, and its use was, therefore, discarded. A form of battery is described, and which was exhibited at the meeting, consisting of tubes of nickel and a special antimonial alloy, which was found to be very durable. This consisted of fifty elements in series united in one casing, and gave an electro motive force of 3.5 volts, and an internal resistance, when hot, of 0.4 ohm, with a consumption of 7¼ cubic feet of gas per hour, and the absolute efficiency is 1.08 per cent. or three times that of the existing thermo-batteries. Such a battery is almost exactly equivalent to two Bunsen elements, and though it is far below the dynamo in efficiency, still it may be suitable for various small installations and for experimental work, owing to complete absence of polarization, as the electro-motive force does not fall on short circuit. The durability is enhanced by a regulator applied to the gas supply to prevent any accidental overheating. The author concludes by stating that the hopes to produce cells which are the outcome of still later researches, and in which the efficiency has been raised to over 5 per cent., and thus almost capable of competing with the dynamo. The description of the construction is withheld; but it is stated that one form is capable of continuously furnishing current for eight 16-candle power lamps at a consumption of 4.5 lb. of coke per hour. This success the author hopes still further to advance, and thereby exceed the efficiency of the dynamo system as a converter of heat into electrical energy.

OLD-TIME DELICACIES.

THE MENU OF A DINNER IN THE SIXTEENTH CENTURY.

A dinner was given in November, 1589, by Marcantonio Colonna, Grand Constable of Naples, on his marriage with the Princess Orsini Peretti, niece of Pius V., at which several Cardinals were present. On the plates were little figures of boys holding shields, on which were the arms of the guests—so that they could find their places without causing confusion—and cupids and angels holding labels, with amorous mottoes and nosegays. The first course of the "Credenza" was of twenty-one dishes, including salads of radishes, capers and kid's feet, heads of wild boars boiled in wine, with their snouts silvered and artificial fire issuing from them, garnished with herbs and flowers; salted buffalo tongues boiled in wine, cock pheasants on their feet, as if alive, and holding perfumes in their beaks, and roast peacocks served with a sauce made of pomegranates and lemons, their beaks and feet gilt and their beautiful necks and tails displayed. In the first course of hot meats were the most delicate birds—ortolans, pheasants, woodcocks, larks, and "tordi" (fieldfares); in the second, of twenty dishes, calves' heads with stuffing, roasted on the spit; bologna sausages, capons stuffed with chestnuts, roast red-legged partridges in paper garnished with sour oranges, roast gray partridges stuffed in the Spanish fashion and sprinkled with rosewater, and a sweet dish called "bocchi di dame" (ladies' mouths), made by the nuns. The third course was of eighteen dishes, among which were pheasants stuffed with truffles, olives and

fresh fennel, garnished with sour oranges and fennel, roat sucking pigs, peacocks larded with lampreys and stuffed with truffles, Indian pigeons, large truffles surmounted by imperial crowns, tender crabs, eaten with salt and vinegar, with a ducal coronet upon each, and lobsters crowned with the papal tiara. The second course of the "Credenza" consisted of twelve dishes, among which were entire truffles served in napkins, and sweet fennel and thistles served with butter in silver plates and garnished with sour oranges and ginger. After the dinner was handed round sweetmeats from different parts of Italy, such as preserved fruits from Genoa, which is still renowned for them, quince-cheese of Naples, "vasetti" from Bologna, "persicata" (peach-cheese), also from Genoa, little boxes (of comfits) from the Romagna, sticks of cinnamon from Bergamo, and bon-bons from Foligno, and Portuguese marmalade.

DOMESTIC DIETETICS.

SPECIALLY PREPARED FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock, brant, grouse, partridge, rabbit, snipe, goose.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, carp, catfish, flounder, halibut, herrings, lobster, mackerel, mussels, oysters, pike, porgie, prawn, rockfish, salmon, sea bass, sturgeon, smelt, turtle, white fish, whiting.

VEGETABLES.—Artichokes, beets, beans, broccoli Brussels sprouts, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savoy, shallots, spinach, squash, tomatoes, turnips, watercress.

FRUITS.—Apples, bananas, blackberries, grapes, melons, oranges, peaches, pears, pineapples.

PRACTICAL RECIPES.

CHICKEN SOUP.—Clean a fowl and put it over a slow fire, with a sliced onion, a coarse stalk of celery, a turnip, and three quarts of water. When the fowl is nearly done add a teacup of rice. When the rice is done carefully take out all the other vegetables and the chicken; cut the breast from the fowl and pound it up, and put it back in the soup. Beat up four egg-yolks, mix them with some cream, and add them to the soup, when it is not quite boiling; season with salt pepper and serve.

ITALIAN RICE.—Chop up an onion and fry it brown in a good piece of butter, stirring constantly; then add three pints of broth, a bay leaf and a pound of rice, washed and picked over. Cover and cook steadily and gently until nearly all the liquid is gone; then take it from the fire and add to it a pinch of red pepper, some tomato sauce, a quarter of a pound of butter, and a quarter of a pound of grated cheese. Cover and set on the back of the stove for five minutes, then serve.

SPICED BAKED PEARS.—Having selected fine pears, wash them, place them in a baking pan, and pour over them a pint of sugar and a pint of water; put another pan over them and bake until tender. Heat to the boiling a quart of vinegar, four cupfuls of granulated sugar, and a teaspoonful each of whole cloves and fine bits of cinnamon bark. Fill your jars with the tender pears, and cover them with this syrup and seal.

PINK AND YELLOW FROSTING.—To color frosting pink add to it a little red jelly, preserve juice, cranberry syrup or cochineal. To give a yellow color halve an orange and squeeze out the juice, cut the yellow part from the rind and put it to soak in the juice; let it lie for half an hour, then squeeze the juice through a muslin bag and add it to the frosting.

SOFT MOLASSES CAKE.—One cupful molasses, half a cup hot water, two and a half cupfuls flour, two tablespoonfuls butter, one egg, ginger, one teaspoonful soda.

JUMBLES.—One cupful sugar, half a cup butter, two eggs; flour to roll out.

APPLE MOLD.—Put in a copper preserving kettle one and a half pounds lump sugar and three cupfuls of water, and cook over a brisk fire until it is crisp, when you try it in cold water. For this amount have ready two dozen apples, pared and sliced; put them into the sugar and cook them, stirring constantly until they are reduced to a marmalade. Oil a mold with a hole in the centre, and fill the mold with the apples; shake them down well and set where they will get very cold; then turn them out on a glass dish, fill up the centre with whipped cream, flavored with orange flavor, and serve.

ALASKAN EXPLORERS.

LIEUT. SCHWATKA'S EXPEDITION UP THE YUKON RIVER.

Advices from Victoria, B. C., dated Oct. 7, describing the exploring trip of Lieut. Schwatka, Dr. Hayes and party into unknown portions of Alaska are full of interest. On leaving Juneau the party, with several Indians, proceeded in canoes up the Yukon River till they reached its source, at Disella. There they disembarked and went on foot in a northwesterly direction, striking in five days the eastern end of great Aklene Lake. There they secured guides, and after despatching letters, got into canoes again and paddled the whole length of the lake till they reached its outlet, really one of many branches of the great Yukon River. It was from this point that the adventurous part of the journey dates. In a single canoe Lieut. Schwatka, accompanied by Dr. Hayes and a white hunter, started down the fork and after several days of hard work got into Lewis River, another branch of the Yukon. The party then got to Fort Selkirk. Here Schwatka fell in with seven American miners, who were waiting for the river to go down before commencing work. A small tribe of Indians was then hired to pilot the explorers in a southeasterly direction, and they struggled on for several days until the magnificent ranges of Stelias hove in sight. There the Indians warned the travelers against attempting to proceed any further in the same direction. Schwatka refusing to listen to their counsel and deciding to keep right on, the Indians left them. They pushed on again, every day bringing them nearer to hills, never before gazed upon by white men. As they approached the foot of one of the smallest mountains it really seemed utterly impossible that they would be able to make a passage. But they went on, up heights, over glaciers and rushing rivers, and in two days had journeyed into the heart of the range. At one place it was only the lucky discovery of a bear trail in the beavy brush that enabled them to proceed. It took five days to make the passage of the range. Bearings were taken, and after descending the mountains they made for the forks of Copper River. In four days they reached its source. After making a canoe of canvas and willow boughs they launched it on the tributary known as Chitty Stone. When they got into the big rapids the boat was upset three times. Then matters went from bad to worse. They kept on until, turning a sharp corner in the boiling torrent, there rose up in front of them two solid black walls, which formed an enormous canyon, through which the river rushed. Here they started on what was destined to be the most thrilling episode of the whole journey. The boat shot into the canyon with fearful rapidity and made from side to side like a shuttlecock. Dr. Hayes and a hunter were thrown out into the torrent, and were only recovered by supreme efforts. Nearly all the valuable instruments of the party were destroyed or lost. Then the boat glided into a beautiful wide stream. At the junction of this stream with the Copper River they met a tribe of Indians, just preparing to go to the mouth of the river to trade. The Delta being reached the party were transferred to the tannery on Prince William Sound, where they waited for the monthly mail steamer to Juneau. They arrived at Juneau in time to catch the Mexico, and reached here yesterday morning. The journey was a complete success. Valuable geological and horticultural specimens were obtained by Dr. Hayes, and Lieut. Schwatka has gathered a fund of information. The exploration opened up over seven hundred miles of new country.

ASTHMA AND GOOSE FEATHERS.

INCLUDING SOME REFLECTIONS UPON GOOSE INTELLECT.

"There isn't one pound of goose feathers used today where there were twenty pounds used ten years ago," said a dealer to a *Sun* reporter. "There are several reasons for this, the principal one being that the feather bed has gone entirely out of fashion. "Now, what do you suppose had a great deal to do with driving the feather bed out of favor? Asthma and hay fever. They have done more than any other thing to lessen the demand for feather beds and pillows, for it was discovered a few years ago that feather beds and asthma had a strong affinity for each other, and that nothing would start an asthmatic wheezing so quickly as a couch of goose feathers. Asthmatics were not long in finding it out, and the taboo of the feather bed and pillow extended to all parts of the country. The goose owes a great deal of its latter-day comfort to the asthma. That is, unless it is true that the plucking of feathers from a live goose is not accompanied by pain, as many people profess to believe, but I have very grave doubts of such being the fact. "Oh, yes. Feathers must be taken from live geese if the comfort and health of people who persist in their attachment to feather beds are to be considered. Dead feathers are as inelastic as husks, and are inimical to the health of the sleeper. New live feathers are by no means pleasant, but dead ones are simply unbearable to a sensitive person. A goose that is being plucked never utters a sound, and it is because of this that the impression prevails among all geese pickers that no pain attends the process. It is just as reasonable to say that it doesn't hurt a goose to yank the feathers by the handful out of the tenderest spots on a goose's body as it would be to say that it doesn't hurt a man to have his whiskers pulled out. I have heard people say that a goose rather enjoys being picked, the sensation being, they declare, something similar to that blissful feeling that overtakes a pig when you scratch his back. That is all nonsense. It hurts a goose terribly to be plucked, and the only reason that it doesn't make a fuss is that it doesn't seem to know enough. A goose will quack and cackle and clatter as if it were suffering more agony than a horse with the colic just at sight of you, but if you corner it up and pelt it with stones it seems to forget that it has a voice, and will take all the punishment you give it without making a noise. "There is much to study about a goose. Just take observation of a flock the first time you get the chance. They will amuse you for an hour. A goose positively has not the slightest idea of its height, depth or breadth. The statement that every goose that passes over the sill of an open barn door ducks its head, no matter if the door is twenty feet high, is as true as true can be. And while a goose will always believe that there is danger of its bumping its head as it passes over the sill of the

barn door, it is equally positive that it can creep through a two-inch knot hole in a fence. I have laughed myself sore more times than once at the persistence of some old goose in trying to enter an enclosure through a hole in a fence hardly big enough for her to get her head through, while a gate wide enough for a team of horses was open within three feet of the hole."

GERMAN PATENTS.—The new German patent law went into effect October 1. Under this law German patents can be applied for at any time within three months after issue of an United States patent. This liberal feature will prove highly beneficial to American inventors, as under the old law of 1877, the German application had to be lodged prior to the issue of the United States patent. Poor inventors can now have an opportunity to safely effect commercial arrangements in this country, and realize something from their inventions before undergoing the expense of a German patent.

BORROWING BOOKS.—We all have friends who need not be reminded how to handle books. They love them as we do. We shall not find their books opened face down on the table, thrown on the floor, or lying on a damp marble. We shall not discover our "tree calf" copy of "Ivanhoe" surmounted by a heap of cherry-stones. Our book-loving friends would be as shocked as we at those outrages which ignorant and unfeeling persons perpetrate against books. But our book-loving friends never wish to borrow! When a friend begs you to read a certain book and urges your use of his copy, your borrowing is perfectly justifiable; and this is the only case where it is. In such an instance the owner assumes all risk of loss or injury. These days of circulating libraries and cheap editions of all standard works render the borrowing of books absolutely inexcusable. Few persons who have not been put to the test realize the difficulty of refusing to lend some particularly cherished book. The only way to preserve one volume is to refuse to lend any. Then people will call you selfish. Those persons who never return borrowed books have not been mentioned, for they have no conscience at all, and should be allowed no quarter.—*Worcester Spy.*

A Tonic

Horsford's Acid Phosphate.

A most excellant and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

DIETARY REFORM.—Doctor: "I see just what is the matter with you. You need something strengthening. Eat a plate of oatmeal boiled, every morning, for breakfast." Patient: "I do, doctor." Doctor (equal to the occasion): "Then leave it off."—*Phar. Era.*

FORGETTING HISTORY.—A "sweet girl graduate" inquires of the Toledo *Blade*, "What macaroni is? Does it grow or is it made?" Great Cæsar! Have you never read American history? Do you not know how Yankee Doodle "stuck a feather in his hat and called it macaroni?" The ignorance of some people is wonderful.—*Dubuque Times.*

LATE SUPPERS.—Much has been said on this subject, but a recent consensus of opinion at a meeting of medical practitioners was the following: Brain workers should not go to bed supperless, but some nutritious, easily digested article should be eaten. A bowl of stale bread and milk, rice or farinaceous food, with milk or hot soup, was highly recommended.

COLOR OF OXYGEN.—Till now oxygen was believed to be as colorless in the liquid form as it is in the gaseous. But the Polish chemist, Olszewski, shows that it is only because thin layers of it have been examined that liquid oxygen has been believed to be with color. He has succeeded in getting a layer of it 30 millimetres thick, and he finds that it has a bright sky-blue color. The discovery is very important in point of view of the absorption spectrum of oxygen.

LANGUAGE AND DEVELOPMENT.—If all true science is based on facts, the fact remains that no animal has ever formed what we mean by a language; and we are fully justified, therefore, in holding with Bunsen and Humboldt, as against Darwin and Prof. Romanes, that there *is* a specific difference between the human animal and all other animals, and that that difference consists in language as the outward manifestation of what the Greeks meant by *logos*.—*Max Muller.*

ARTIFICIAL ASPHALT.—By heating resin with sulphur to about 250 deg. C., a reaction takes place, attended by the evolution of sulphureted hydrogen, and leading to the formation of an almost black pitchy substance containing sulphur and resembling Syrian asphalt in many of its properties. Thus it is insoluble in alcohol, but dissolves readily in chloroform and benzene, and is sensitive to light in the same way as Syrian asphalt, for which it can be substituted for photographic purposes.

SURPLUS PRODUCTION.—California has more than bountiful harvests this year. Not nearly all of her fruit can be disposed of, and the potato crop is so enormously large that thousands of bushels are being allowed to rot in the fields. A prominent grower says that in one district, near Sacramento, no less than 60,000 bushels of potatoes were not dug, because it would not pay to market them. Some of the growers ploughed up the potatoes and allowed them to remain on the ground as a fertilizer for the other crops which were put in.

HORSE-POWER.—To an inquiry how to compute the horse-power of an engine, the *Scientific American* replies: Multiply the square of the diameter of the cylinder by 0.7854, and this product by the mean pressure in the cylinder. The mean pressure, assuming the usual practice in small engines at five-eighths cut-off, will be 0.92 of the boiler pressure. Multiply the last product by the speed of the piston in feet per minute and divide by 33,000 for the horse-power. 2. How much power would an engine have that has a 3×5 inch cylinder, with 50 pounds pressure per square inch on the piston head, and making 100 revolutions per minute? A. For your engine this

$$\text{would be} \frac{3^2 \times 0.7854 \times 100 \times 0.92 \times \frac{5 \times 2}{12} \times 100}{33{,}000} = 1.6 \text{ h.p.}$$

Subscriptions $1 per year. Now is the time to subscribe.

Graham Muffins

BY MARIA PARLOA.

For twelve muffins there will be required half a pint of graham, half a pint of flour, one generous tablespoonful of sugar, one tablespoonful of butter, half a teaspoonful of salt, one teaspoonful and a half of Cleveland's Baking Powder, one egg, and two gills and a half of milk.

Mix the dry ingredients and rub through a sieve. Turn the bran from the sieve into the mixture. Beat the egg till light and add the milk to it. Stir this into the dry mixture. Add the butter, melted, and beat well for half a minute. Bake in buttered muffin pans for half an hour in a moderately hot oven.—(Copyright, 1891, by Cleveland Baking Powder Co.)

Use only Cleveland's baking powder, the proportions are made for that.

Cleveland's Baking Powder is the anti-dyspeptic leavening agent. The leaven comes from cream of tartar and soda, nothing else; no ammonia or alum.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of 'Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. PURE PEPSIN

In Powder and Scale.

MANUFACTURED BY

ARMOUR & COMPANY, Chicago.

Guaranteed free from adulteration or make-weights; of excellent physical properties and high digestive power.

Under similar conditions, **ARMOUR'S PEPSIN** will exhibit greater activity than any other pepsin now before the profession.

The Manufacturers will be pleased to supply members of the Medical Profession with samples of their Pepsin, and with full details regarding digestive strength, if desired.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

HOWARD STREET, BOSTON, MASS.

THE QUEEN'S PRIZE SCHOOL OF HISTORY.

About two years ago the publishers of THE CANADIAN QUEEN added what has proven to be a very popular and successful feature to their publication in establishing their Prize History School. It has offered competitive examinations in English, Canadian and American History, giving valuable rewards to those making the most correct answers. During this time there have been added the names of over forty thousand new subscribers to their books. Rewards have been made by THE QUEEN which have cost them in cash over ten thousand dollars. THE QUEEN'S Prize School of History has received the sanction and support of the clergy, press, and, in fact, of the best people of the Dominion of Canada. The following, taken from a leading daily newspaper, expresses an opinion which is universal:

A HANDSOME PRIZE.

AN EVIDENCE OF WHAT A GENUINE MAGAZINE COMPETITION OFFERS.

"On Friday there arrived from Toronto, for Miss M. Hora, a handsome Shetland pony, harness and cart, being the first award in the Royal Quilt Competition of THE CANADIAN QUEEN magazine. It attests the genuine nature of the magazine's contests by its excellent condition and value. THE QUEEN has frequent competitions and has made innumerable awards, displaying a generosity quite surprising to those who have had experience of the limited field for Canadian journalistic enterprise. But THE QUEEN has been a success as a business venture from the start, and is growing in literary excellence steadily. It covers the field of fashion, as well as light reading; talks to the household, the young, and, indeed, all home classes. The competitions have been used to assist the introduction of the magazine, for where it is introduced it is quite certain to remain a monthly guest. The leading prizes have been made, as instance this latest to Kingston, while many smaller prizes have rewarded the moderately successful among competitors. THE CANADIAN QUEEN is truly royal in its ways."—*The (Kingston, Ont.) Daily British Whig*, June 27th, 1891.

QUESTIONS IN AMERICAN HISTORY.

1.—Give the names of the early navigators who it is claimed by historians first discovered America.

2.—From whom has America taken its name?

3.—What class and nationality first settled Virginia? New York? Massachusetts? Pennsylvania? Maryland?

4.—What action did the Continental Congress of 1774 take and what was the result of that action?

5.—What was the first battle fought in the War of the Revolution?

6.—What nation rendered the Americans great assistance in the War of the Revolution?

7.—Give the names of the committee appointed to draft the famous Declaration of Independence.

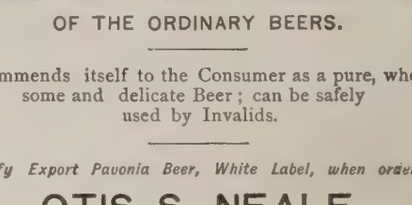
8.—What was the date of the signing of the United States Constitution?

9.—After becoming a nation and before the great Civil War, what were the principal conflicts which engaged the Americans?

10.—What was the direct cause of the Civil War? What Generals of the Northern Army have occupied executive positions under the Federal Government since the closing of the War? Who was Commander-in-Chief and who were the principal Generals of the Confederate Army during the struggle?

11.—How long did this War last and what is the computed loss of life?

12.—What can be said to day of the United States as a nation?



To the *First* gentleman sending the correct answers to the above questions in American History the publishers of THE QUEEN will present **"Majestic"** acknowledged the **Handsomest and Finest Riding Horse in Ontario.** ("Majestic" is sixteen hands high, thoroughbred, seven years old, and valued at $350.00.) To the *First* lady the publishers of THE QUEEN will present an elegant **Jacket of Genuine Alaska Seal** to be made according to the measurement supplied by the winner. To the *First* boy under sixteen years of age the publishers of THE QUEEN will present a **Little Giant Safety Bicycle** valued at $75.00. To the *First* girl under sixteen years of age the publishers of THE QUEEN will present an elegant **Music Box,** playing twenty tunes, finely finished and valued at $55.00.

To the gentleman from whom the *Last* correct answers are received before the close of this Competition, the publishers of THE QUEEN will present a **First Cabin Passage to Europe and Return** and **$200 in Gold** for expenses. This trip can be taken by the winner any time before October 1st, 1892. To the lady from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Pony, Cart and Harness.** To the boy under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Solid Gold Watch** containing one of the best American movements, and valued at $75.00. To the girl under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present an elegant **Solid Gold Watch,** containing one of the best American movements, and valued at $65.00.

ADDITIONAL PRIZES IN ORDER OF MERIT: Silver Tea Services, Ladies' Gold Watches, Silk Dress Patterns, French Mantel Clocks, Portiere Curtains, Toilet Cases, Manicure Sets, and many other useful and valuable articles.

The object of the publishers in offering these liberal prizes is to introduce THE QUEEN Magazine into **new** homes. Answers must be mailed *on or before* November 10th, 1891, and must be accompanied by $1.00 for one year's subscription to THE CANADIAN QUEEN. Prizes awarded to subscribers residing in the United States will be shipped to them **free of duty.** The distribution of awards is in the hands of disinterested persons, and decisions will be based on the correctness of answers. Use your own language in wording the answers. No corrections can be made after your answers are mailed. THE QUEEN is a large, forty-eight page family magazine, especially interesting to ladies and children, and visits regularly **over one hundred thousand of the best homes** in Canada and the United States. The awards in THE QUEEN'S Prize School of History are made strictly with regard to merit, without partiality to persons or locality. The decisions must be accepted as final. If you have never seen a copy of THE QUEEN send six U. S. two cent stamps and receive a late number, post paid, containing letters from those who have received rewards in previous contests.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY'S SON,

NEW IBERIA, LA.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

KITCHEN EDUCATION.

One of the greatest difficulties of modern civilization is to be found in the family kitchen, and the fact that disaster seldom occurs there is proof of the wonderful self-adjustment of that civilization. The old hunter's saying that "Water cleans itself in running over seven stones," might well be paraphrased by some epigrammatist to declare that the complex conditions of modern life, at least in our community, counteract and correct one another with the same beautiful accuracy that marks the play of natural laws. The kitchen is the laboratory of the home. In it are constantly in operation chemical changes and combinations of the most important description. Upon the accuracy of these operations depends the health, the life of the entire family. Upon the quality of the ingredients, and the skill and care with which they are combined, hangs the whole question of adequate nourishment. Philosophers tell us, indeed, that even more than our physical welfare is conserved or destroyed according to the management of the kitchen. One man says that no husband ever ill-treated a wife who was a good cook. All agree that domestic peace, and even the coherence of the family, are easily destroyed by evil cookery. The difficulty comes in just at this point. It seems to be a necessity, or almost a necessity, of our life that the most of the cooking, at all events, for each family should be done in its own kitchen. Co-operative housekeeping is not yet well advanced even in its experimental stage. This one most important department of the home must therefore be under the personal superintendence of some one of the family, and here again the conditions of civilization render it almost inevitable that the wife should be that one, unless, indeed, there be a grown daughter, or unless, as is too frequently the case, the responsibility rests upon a servant. Now, it is not a disparagement of the female sex to say that not one woman in a hundred has any knowledge whatever of some of the simplest elementary laws that really govern her cooking. Some empirical knowledge of results, indeed, she must have, in order to cook at all, but as for the real fundamental knowledge which underlies all cookery she has none of it. In fact, not two per cent. of cooks, so-called, realize that any such knowledge is necessary or even desirable. A parrot-like acquaintance with recipes and a little mechanical skill in manipulation are, from their point of view, all that is required. Mankind long ago learned to insist upon some fundamental knowledge on the part of the operatives who run its machinery and steam boilers, but it has not yet reached the point of requiring diplomas of its cooks. Consequently, the delicate machinery of the human body is deranged, and explosions occur far too often. Yet we are a well-nourished and reasonably well-fed people—a thing which does not seem possible under the conditions stated. That they are not over-stated is certainly known by all who have given intelligent consideration to the subject. There is a manifest paradox here which can only be understood by taking into account the balancing laws of civilization referred to. The very highest skill—the most superb probity known to mankind—stand behind the ignorance of the cook. There was never a time in the history of the world when the supplies of the kitchen were as wholesome and as honest as they are to-day. It is the fact that the housekeeper, unless she is devoid of ordinary prudence and common sense, can hardly buy dangerous food that protects the community. To this end the AMERICAN ANALYST has contributed not a little, but it is proper to say that natural laws and the general honesty of mankind have done far more. Not seldom an article may be found in some sensational newspaper describing the awful evils of adulteration, and declaring that pure foods of various kinds are almost impossible to get. Happily, such stories are false. That there are harmful adulterations known and used is true. It is an important part of the work of the AMERICAN ANALYST to discover and expose instances of the kind, but it is also true that they form a very small percentage of the food supply. Yet is it not worth while to consider always the importance of better education in the kitchen?

WOMEN AT THE WORLD'S FAIR.

A meeting of the Press League, a National World's Fair organization of active women writers, was held in Chicago, October 13. Mrs Potter Palmer addressed the meeting, and among other things said: "The Board of Lady Managers desires that the women of all countries may participate in the privileges given it. The Board has decided that at the coming Exposition it will not attempt to separate the exhibit of women's work from that of men, for the reason that a separate exhibit for women would necessitate the duplication of all the buildings which were planned for the Exposition. Women will, however, have another opportunity of showing work of superior excellence in the Women's Building. The committees of women organized in all countries as auxiliaries will be asked to recommend objects of supreme excellence that women have created. There will be a library stocked with books written by women. It is desired that this should be complete and that it contain all the work of women upon the exact sciences, philosophy and art, as well as the best of their poetry and fiction."

WOMEN'S CHRISTIAN ASSOCIATIONS.

The eleventh biennial conference of Women's Christian Associations of the United States and Canada began in Chicago, October 13, to continue four days. Mrs. Leander Stone, of Chicago, delivered the address, of welcome which was responded to by Mrs. Springer, of St. Louis. Mrs. C. N. Judson, of Brooklyn. N, Y., presided. New officers were chosen as follows: Miss M. E. Rawson, of Cleveland, second vice-president; Mrs. William Simpkin, of Richmond, Va., secretary; Mrs. A. S. Chamberlain, of Chicago and Mrs. Edward Ely, of Chicago. A paper on "The One Thing Needed," was read by Mrs. Angus Campbell, of Memphis. Among others who participated were Miss Grace K. Dodge, of New York; Miss C. V. Drinkwater, of Boston; Miss Coman, Wellesley College; Miss Kate McLane, Baltimore; and Mrs. William O. Gould, San Francisco.

PROPOSED METRIC SYSTEM.

In our issue of July 23, we described in our editorial columns a modification in the present system of weights and measures proposed by a Danish engineer named Hanssen, whereby it could be readily converted into a true decimal system equally convenient with the French metric method. We observe that the proposition is receiving extensive attention in directions likely to influence public sentiment. The Boston *Popular Science News* and the *Scientific American* of this city have devoted some space to a consideration of its

READ PAGE 513

merits, and the latter journal quotes the *Travelers' Record* as saying: "We have never been enthusiasts over the French metric system, says the *Travelers' Record*. Its original unit is as purely arbitrary as the foot itself; and all its secondary units are so violently out of gear with everything existent that the enormous labor and loss of the change can hardly be made good by any service. It is possible to pay too high a price even for a decimal system with interchangeable parts. A system is proposed (and detailed in the *Chemical News*) by a Danish engineer named Hanssen, which is so wonderfully simple and easy that we hope to see it speedily adopted through all the world except those committed by pride or interest in the French scheme; it has almost all the merits of the other system and almost none of its immense drawbacks. Nobody seems before to have noticed the very close approach to interchangeability between our principal units of weights and measures. Mr. Hanssen proposes to increase the inch and foot to 1.000403 times their present length, or about $\frac{1}{2500}$, less than $\frac{1}{200}$ of an inch to the foot, which for ordinary purposes is no change at all; and the ounce, pound and imperial gallon will need no change. A cubic foot contains 436,971.78 grains of distilled water; the new cubic foot would contain 437,500 grains, or just 1,000 ounces avoirdupois. Sixteen cubic feet would equal exactly imperial 100 gallons, or one hectogallon, which will weigh just 1,000 pounds. The foot will be divided, like the metre, into decifoot, centifoot, millifoot; there will be hektogallon, dekagallon, gallon, decigallon, centigallon, milligallon; and so on with others. Of course, governments must first agree on the basis; but it could quickly be made what the French metric system never will become—a really popular utility, displacing the old standards.

RAIN—TO ORDER.

THE RECENT RAIN-MAKING EXPERIMENTS AND THEIR POSSIBLE OUTCOME.

In a handsomely illustrated article on "Rainfall Experiments," Mr. N. A. Jennings describes, in *Harpers Weekly* of last week, the recent government tests of the theory first propounded about twelve years ago by Mr. Edward Powers of Delavan, Wis. The writer says: "While the production of rain by properly directed scientific methods is a comparatively new idea to the general public, it has been discussed and written about and theorized upon very thoroughly by a few enthusiasts for many years. Only recently, however, have their theories received any substantial recognition or encouragement, and, in view of the limited number of the experiments made within the past few months by the special commission of the Department of Agriculture, it would be premature to attempt to draw final conclusions regarding their practicability or worthlessness. It will require a large number of thorough tests of the rain-making power of man upon the concussion theory to fully establish its practical value. However, the subject is one of extreme interest to the public at large and particularly to that great class of workers to whom the question as to whether man can by scientific means bring moisture from the sky at will, may mean far greater prosperity than they may ever hope to attain by having to rely, as they do now, upon nature's caprices. Curiously enough, no sooner had the government commission started for the arid regions of Texas to test one rain-making theory, than a rival in the manufacture of showers appeared before the public with the claim that he could produce rain whenever he chose to do so. But Frank Melburne has not yet deemed it advisable to acquaint the public with his method of rain making, and consequently any criticism of his work must be without true value. It would seem from the reports of his experiments, which have been published from time to time in the daily newspapers, that in a number of instances he certainly did produce rain when the Signal Service officers predicted fair weather. Upon several other occasions he failed to do so, and consequently it must remain an open question whether his method is practical or not, until he shall have made extended experiments, and shall have permitted men of scientific attainments to have some insight into his mode of operating. The tests made by Special Commissioner General Robert St. George Dyrenforth for the Department of Agriculture have, on the other hand, had no veil of secrecy drawn about them, but have been made publicly, and any investigation by scientists and by the public at large has been welcomed. The theory upon which General Dyrenforth and his corps of able assistants have been working in Texas is one which for twenty-five years or more has been persistently advocated and expounded by Mr. Edward Powers, C. E., of Delevan, Wisconsin, and if, after a thorough trial, it shall be found practical, Mr. Powers will have the honor of being the man who by his unremitting efforts forced it upon the world. The aspiration of mankind in this age of progress are limitless, and the attempt to control the elements, which a score of years ago would have been looked upon as an impertinent effort to usurp the powers of Providence, is now viewed by the public at large as only another step in the onward march of science. The average citizen merely shrugs his shoulders as he looks up from his daily paper and says, 'I see here that they are trying to make it rain by artificial means; what will they do next?'" The theory of producing rain by concussion, as set forth by Mr. Powers in his book *War and the Weather*, may be briefly outlined as follows: Rain in its natural state is nearly always produced by the rapid union of two or more volumes of moisture-laden air which differ in a more or less great degree in temperature, the several portions, when mingled, being incapable of retaining the same amount of humidity that each held in suspension before they united. If the amount of moisture held by the two or more volumes is great, then the excess is great in proportion when they mingle, and it falls as rain; if it is of slight amount, it forms cloud. It has been discovered by scientific investigation that there are constantly flowing in opposite directions over the entire area of the United States and the lower portion of British America two vast currents of moisture-laden air. One of these flows from the west to the east, and is known as the Equatorial Current. It is a continuation of the south-west trade-wind of the Pacific Ocean, and bears with it a great quantity of moisture—which it has received by evaporation in travelling over two thousand miles of tropical seas. The Equatorial Current is, therefore, quite warm and very humid. Above the Equatorial Current, and flowing in an almost opposite direction, from east to west, is what is known as the Polar Current. This great air stream, having circled around the north pole and crossed the arctic seas, is comparatively cold, and cannot for that reason contain a great amount of humidity. However, it probably does hold almost continually as much moisture as it is capable of sustaining. When for any reason, portions of the Equatorial Current are forced up into the Polar Current, and the warm and cold bodies of the humid air mix, rain results; or, in other words, when the equilibrium of the perfectly poised strata of air is disturbed, a storm of more or less violence, according to the area of the disturbance, is caused. Now it is well known that any violent explosion sets the atmospheric waves in rapid motion, and they beat upon any opposing obstacle with a force which may be likened to the breaking of the waves of the sea on a rock-bound coast. A familiar example of the force of these air waves by concussion is that of the breaking of windows by an explosion a long distance away. From a logical study of these natural phenomena and meteorological conditions of the upper air strata, Mr. Powers concluded that it was within the power of man to so set the lower portion of the air in violent motion as to cause its waves to beat upward against the ever-present and slow-moving Equatorial Current, disturb its equilibrium, cause it to mingle with the Polar Current above, and so by their mixing produce rain. In support of this theory, Mr. Powers was at great pains to collect data regarding the undisputable fact that a great majority of the world's battles, where there was heavy artillery firing have been succeded by copious rains, and he presented a formidable array of statistics to show that his ideas upon the artificial production of rain were correct. Like most men with new and great plans for the benefit of mankind, Mr. Powers met with but little encouragement, and he encountered ridicule or even disheartening cold politeness wherever he attempted to promulgate his theories. By dint of perseverance, and buoyed up by the belief that the practical working of his theory would confer upon mankind for all time a measureless boon, he at last succeeded in gaining some powerful proselytes to his cause. Among these was ex-Senator Farwell, of Chicago. Senator Farwell was so deeply interested in the subject that he caused the appropriation under which the recent experiments have been made to be included in the general appropriation for the Department of Agriculture at the last session of Congress. As only $9000 was appropriated for the rain-making experiments, and as Mr. Powers had estimated that at least $80,000 would be required for one test, it was thought advisable to put the practical working of the matter into the hands of another man. General Dyrenforth, who is a graduate of the University of Heidelberg and of the Polytechnic at Carlsruhe, and who was a believer in the theory of producing rain by concussions, was selected to conduct the experiments. A full account of how each experiment was made would occupy too much space for the limits of this article. I have been present at all the tests, and have observed them carefully, and the deduction which I have drawn is that while, with the present limited knowledge of the subject, it would be extravagant to attempt to transform the desert places of this country into fertile farming lands, still the benefits which will be realized if rain can be produced at will, even in more favored localities, will be so vast that it is well worth while to continue in the lines laid down. That by far the greater number of the tests were successful I know from personal observation. Those which were made at Midland, on the southern edge of the Llano Estacado, were particularly encouraging. All of that country is dry and almost barren, and almost no rain had fallen there for months previous to the advent of the rainmakers. Immediately following several of the experiments heavy rains fell within a radius of from forty to one hundred miles of the place where the explosions were made, and, what was even more important, the rain fell heaviest immediately at the place where the experimenters were. At El Paso the efforts to produce rain were not nearly so successful. According to the officers of the Signal Service at El Paso, that town and its immediate vicinity are peculiarly exempt from the meteorological and barometrical conditions which prevail in nearly all other portions of the United States. Quite often heavy rains will fall on all sides of the valley in which El Paso nestles, and day after day storms will be reported from all points of the compass, yet not one drop will fall on the city. On the day before the explosions were made at this place, Mr. John T. Ellis, who, in General Dyrenforth's absence, had charge of the experiments, made a balloon ascension for the especial purpose of discovering if possible whether he could find the height of the equatorial and polar currents. He entered the equatorial current at a height above El Paso of about 7,500 feet, but was surprised to find that even in that aerial river the humidity showed but a slight percentage. The next day the barometer was exceedingly high, and the humidity was only fourteen per cent. in the city. The indications for rain of any kind, natural or artificial, were very slight; it was what was known as a "clearing day," and the forecasts of the Signal Service officer

were for continued fair weather. Not only was this the case in El Paso, but the same conditions were reported as existing within a radius of one hundred miles from El Paso. The means for producing the concussions desired were on a grand scale. An immense quantity of dynamite and rackarock powder was carried to the summit of Mount Franklin by plucky little burros ; many large ballons, made to contain from six hundred to twelve hundred cubic feet of oxyhydrogen gas —one of the most powerful explosives known in chemistry—were mady ready ; over a hundred 21-pound bomb-shells were ranged beside mortars, ready to be thrown high in the air and there exploded. The rather elaborate programme was carried out without hitch or accident of any kind, and the people of El Paso and the many distinguished visitors who had come from Mexico and near-by States were treated to an exhibition which has been without parallel in the United States since the war. The number of explosions made on that day was greater than that of the shots fired from cannon in many important battles. The concussions were so great from the explosions of the balloons that the buildings shook perceptibly, and when charges of from thirty to fifty pounds of dynamite were set off at a time plaster fell from ceilings, and women and children rushed out of doors in terror. This bombardment of the cruelly unsympathetic and unresponsive sky was kept up for twelve hours by the efforts of the rainfall men and a detachment of soldiers from Fort Bliss. Not a drop of rain fell in El Paso within ninety-six hours after the last explosion, but reports from the surrounding country, and particularly from the Mexican State of Chihuahua, stated that heavy rains had fallen all the way from fifteen to one hundred miles from this city. In Chihuahua these rains were sorely needed, as there had been a severe drought in that State for many months. The result of the firing in El Paso itself was the rapid falling of the barometer, a marked increase in the percentage of humidity, and, what was never known to occur there before in the history of the town, the precipitation of a heavy dew there that night. In view of this remarkable barometric change produced by the experiments in El Paso, and in view of the copious rains which followed all the tests near Midland, it is certainly safe to say that the concussion theory of rain-making has now arrived at a stage when the question is not, can man produce rain? but rather, under what conditions and in what manner must he proceed to do so? I believe that the correct answer to this latter question will be given before the end of the century.

INTERPLANETARY COMMUNICATION.

WILL MAN EVER VISIT MARS OR THE MOON?

The distinguished French astronomer, Amédée Guillemin, gives his views on the subject indicated by the title of this article in a paper published in *La Nature*. After conceding that striking astronomical discoveries, of a kind to arouse deep interest in the general public, have been rare for some years past, he asks, "Are we to conclude, therefore, that there is no work going on in the observatories, and that there is no progress in science? No one who keeps posted in regard to the daily labors of the astronomers of the two worlds, who reads, or at least glances through, the periodicals containing accounts of these labors, will so conclude. Such a conclusion would be refuted by that new enterprise which bids fair to be fertile in results, the construction of a map of the sky effected by photography, and which will give the exact position of the stars up to the fourteenth magnitude. This map, of course, is not sufficient to create a sensation like the unexpected arrival of a comet, which would draw skyward the eyes of all loungers along the streets; but the importance of astronomical observations must not be measured by the noise they make. Undoubtedly it would cause a genuine sensation if the legacy of 100,000 francs left by the good lady of Pau (see *Literary Digest*, vol. iii., p 486) should result in establishing communication between the earth and some other heavenly body. For my part, however, I do not see what astronomy, or even our poor humanity, would gain thereby. It is said that the Academy of Sciences is disposed to accept the legacy, thanks to a clause in it like that which has converted the Bréant prize into an annual recompense, decreed to the authors of discoveries which have advanced the question of the cure of cholera. In like manner, the annual income of the sum bequeathed by Madame Guzman, the lady of Pau, can be used to promote researches relating to the constitution of the heavenly bodies. To any one who has precise information in regard to the actual knowledge of astronomers as to the physical aspect of the stars of our system, it is evident that there are two only on which can be based the hopes of those who believe in the possibility of interplanetary communications—the Moon and Mars. First of all, as to the Moon. Its distance from the earth (less than 400,000 kilometers), the clearness of its disk, the ease with which can be distinguished with the telescope features of small dimensions, the absence of all nebulosity of a nature to conceal spots, would render our satellite eminently suitable for sending signals to the earth. We must believe that the inhabitants of the moon have not yet dreamed of sending signals to the earth, since the numerous observers of her disk, the laborious makers of lunar maps, the Beers and Mædlers, and, above all, the Schmidts, have not perceived any signals. There is another question, however: Are there, can there be, inhabitants in the moon, where there is neither air nor water? If there is a point universally admitted, it is that there are no inhabitants of the moon. Under these conditions it would appear superfluous for us, on the earth, to make efforts to communicate with the inhabitants of the moon; and it is a pity ; for the other heavenly body to put questions to, the planet Mars, is, alas! infinitely less favorably situated for the establishment of an interastral telegraph. When in opposition to the earth, Mars is still about 14,000,000 leagues—that is, 55,000,000 kilometers—from us, or one hundred and sixty times more distant than the moon ; at that time the diameter of its disk stretches to 25 seconds. According to Schiaparelli, the smallest objects visible on the surface, under the most favorable circumstances, when there is a luminous spot on a dark background, or a dark spot on a luminous background, have a diameter equal to one-fiftieth of that of the planet—that is to say, of about 137 kilometers. This lowest limit can be reduced, it is true, by using object glasses of very great size, which will magnify more. Even then, however, it is certain that luminous signals on Mars, for example, to be seen from the earth, must have enormous dimensions. The inhabitants of Mars, more advanced than ourselves in astronomical science, as one of our cleverest astronomers supposes, if they think of bringing about an exchange of telegraphic communications with their terrestrial neighbors, will have to use signals with diameters which must be measured by kilometers in every sense. Do the Martian people dream of such a thing? If they do, there is something which, I apprehend, will bother them a little. The earth, when in opposition to Mars, is for observers there in conjunction ; our planet is then lost in the rays of the sun and invisible to Mars, except the earth at that time happens to be passing across the radiant disk of our luminary. Then the earth is a little black and round spot, upon which, alas! the Martian astronomers, do their best, can distinguish nothing. At the quadratures of the two planets, the earth would be better posted for observations from Mars, but the two bodies will be at a much greater distance from each other. I stop here, not wishing to discourage altogether the candidates for the prize of 100,000 francs, so generously and so imprudently offered. Perhaps, however, I may be permitted to state my conclusion, which is, that the problem of interplanetary communication is not yet very near solution. That conclusion, I imagine, will not be contradicted by serious astronomers. I have faith in the indefinite progress of science, while convinced that such progress has limits; but I also think that science is not profited by allowing the imagination to pursue chimeras, and I am inclined to believe that interplanetary communication is a chimera."

OLEOMARGARINE IN RUSSIA.

STRINGENT LAWS TO PREVENT DECEPTION.

A law enacted May 11, 1891, regarding the manufacture and sale of oleomargarine and artificial butter in the empire is summarized in the *Milch Zeitung*, No. 49, 1891, as follows :

1. The law understands by the term "margarine" the material prepared from fresh fat beef, after the separation of the stearine, according to the method of Mege Mouries ; and by "artificial butter" the material prepared from 100 parts by weight of margarine and 100 parts by weight of milk or ten parts of cream.

2 The manufacture of margarine and artificial butter is restricted to establishments fitted up exclusively for this purpose.

3. Such establishments, as well as slaughter-houses furnishing them with crude materials, will be under the supervision of special officials, to be appointed by the Minister of Finance. The expense of this supervision is to be contributed by the manufacturers.

4. It is forbidden (*a*) to color margarine or artificial butter the color of cows' butter ; (*b*) to mix margarine or other fats with cows' butter for the purpose of selling, to bring such mixtures into the market, or to store in places where cows' butter is kept or sold.

5. All vessels in which it is exposed for sale must be plainly marked "Margarine" or "Artificial Butter." Tubs or boxes containing these materials also bear the name of the manufacturer.

6. All stores or establishments dealing in oleomargarine or artificial butter must display in a prominent place a placard to this effect.

7. The selling of these materials in stores which are especially for the sale of dairy products is not allowable.

8. The importation of these materials from other countries is forbidden.

9. The Minister of Finance and the Minister of the Interior are charged with the execution of the law, and the seeing to it that the manufacture is carried on under proper sanitary conditions.

The penalty for offering adulterated cows' butter for sale, or the storing of such adulterated butter where cows' butter is made or sold, is forfeiture of the material and imprisonment not exceeding one month, or a fine not exceeding 100 rubles ($77.) The penalty for disregard of the other clauses of the law as to manufacture and sale, is forfeiture of the material and a fine not exceeding 100 rubles.

ELECTRIC MOTORS.—George Westinghouse is said to have invented an electric street-car motor which will pull 28,000 pounds. With Edison already confident of success in the same direction, the surface transit problem ought to be solved in the immediate future.

FEAR AND FATE.—Few people die of the peril they most fear, says a student of casualties. Ropewalker Dixon, who crossed 350 feet above the whirlpool rapids at Niagara on a three-quarter-inch cable last July, has just drowned while bathing. So the man who fears the gout may go untwinged all his days only to slip on a banana peel.

YOUNG ADVENTURER.—Capt. F. E. Younghusband, whose name has been frequently in the cable news of late in connection with the mysterious land of Pamir, "the roof of the world," is only twenty-four. Three years ago he travelled from Pekin to India, 7 000 miles Through hostile territory, receiving a medal from the Royal Geographical Society as the most distinguished of recent explorers.

BRIGHT STORIES.

HOW IT GOT INTO PRINT.

A Story of a Canadian Village.

Walter Blackburn Hart in the *Boston Transcript*.

(*Concluded from page* 408.)

The event with all its details and many additional facts, which, however, were regarded as dubious and superfluous by the newspapers, was discussed and related in the corner grocery store—the parliament of every Canadian village—for years and years after the great world had forgotten all about it. The great world recognized the existence of St. Barthelemi for one week—a sad week for St. Barthelemi. The event belongs to the history of St. Barthelemi, and it will be immemorial there. The reason is that it was a sad one, and country folk have long memories for such things. The people of the cities are more inured to sadness; it is but the daily dish of the newspapers with them; it is writ large across the faces of the bustling crowds in the streets. And to the visitants from the mysterious realms of newspaperdom who gave St. Barthelemi a sudden brief importance, it is all merely *news!* These, too, have their sorrows, but they have hardly time to think about them.

And this is a true account of the real event.

It was a bleak December night, and the snow was falling heavily, enwrapping the scattered houses of the village in a sombre gray mantle, and making the parlor of the Revere doubly inviting by contrast.

About nine o'clock the door of the bar-room was pushed open in an uncertain kind of way, and every one looked round in surprise as a stranger, a short dark man, staggered up to the counter. "Topsy" was seated upon it chatting gayly with old Runians, who was repeating his quaint sayings to a little knot of men laughing and smoking at his elbow. The group gave way to the stranger, who suddenly pulled himself up straight and looked fixedly at the child.

Old Runians, with his big brown hands on his hips, looked at the stranger with disapproval in his keen gray eyes. The man was drunk, and Peter always used to say that although he kept an inn he was an advocate of temperance. He made it a rule never to serve any liquor to a man already under its influence. The people of St. Barthelemi knew this, and they knew also that no blasphemy was allowed in the Revere House, more especially when "Topsy" was within hearing. The host declared that he was incorruptible, but he would retire if little pitchers could not be as much respected under his roof as under the parson's. "Topsy" was accordingly lifted down and told to go to his mother in the kitchen.

"I don't want you here, stranger," said old Peter, quietly, leaning aross the counter. "Yes, oblige me by taking yourself off."

"I am not such a stranger as you think, Mr. Runians," replied the dark man with an ugly grin and a burst of profanity. "You can just keep that sort of twaddle to yourself. I want a drink—and I want to talk business."

The big old sea captain laughed, but his brows contracted and the crowd left off talking among themselves. Old Runians was not accustomed to have any man in St. Barthelemi dispute his authocracy in his own house, and his great physical strength had made him thoroughly respected and feared. The implied contempt of the stranger amused him.

"See here, mister, I don't know you, and I don't want to. Now get out of my house without any more argumentation." This was one of Runian's pet big words.

"But I know you, and I'm going to talk with you. See!—that boy you sent away is *my* boy. I'm Joseph Joselin. Now do you know me?"

Old Runions turned white and said nothing.

Now you know me, eh? I'm Jose Joselin? And I'm goin, to take the boy away with me before I leave this place." And Mr. Joselin laughed until he almost lost his grip on the counter and his equilibrium at the same moment.

The little crowd gathered round the man with curiosity. One or two of the inhabitants exchanged glances as they looked keenly into the evil bloated face of the stranger. Runians looked at them inquiringly.

"It's Joe Joselin, sure enough," said one.

"Of course it is—of course it is. And I'm as dry as a lime kiln."

"Joe always was," said a man in the rear, laconically.

A great struggle was going on in Peter Runians's breast. He was one of those untutored, powerful men who, when aroused, have to torture themselves to restrain their passion.

"I would advise you to go back to where you've come from, he said, speaking very slowly. "St. Barthelemi can do without men of your sort. And if you're Joseph Joselin, I'm no fool. You've got to prove it by law. A man can't die for twelve year and then come to life agin, without a little legal formality."

"I can prove who I am soon enough. So look here you sea cook, be civil! I know you, and you can't skeer Joe Joselin. Who are you to refuse a gen'lman the drink he wants to pay for?" and he dashed some money on the counter. "'Sides, I want my friends here," turning to the men around him, "to drink to Joe Joselin's health and Joe Joselin's brat. He's old enough to be useful now—and I'm going to have him."

"Come, come, my man, don't be saucy. Be off, now"—in a voice of thunder, as his heavy fist descended, making all the glasses and decanters rattle. "Be off; and I'll see when you are sober. D' ye think I'm goin' to send my boy off with you on such a night as this?"

"Have you the cursed imp—impudence to say—"

"I give you just one minute," said Runians, interrupting and glancing round at the old-fashioned clock, "to get out of the house. D' ye hear me? If you're not gone then—" Old Runians shrugged his shoulders and the crowd laughed.

"I'm goin' to stand drinks—and I'm goin' to have that brat," said Joselin, with the persistency of intoxication.

Runians looked impatiently at the minute hand of the clock. "You're not; so make up yer mind to that."

"I won't, eh?" Mr. Joselin turned away and reeled toward the passage leading toward the kitchen.

In a moment Peter Runians was no longer an innkeeper—he was the old sea captain, in a perfect tempest of passion. He sprang after the man, and, catching him by the collar, swung him round as if he were a wet spaniel. "Damn you!" he cried, purple with anger. But as he reeled the cobbler caught up a glass bottle from the counter, and in an instant he had dashed it into Runian's face. In its descent the vessel struck the oil lamp hanging above their heads, and it fell with a loud crash, leaving them in darkness. There was a sharp cry of pain from Runians, followed by a half-stifled yell from the cobbler—a general scuffle, and a confused noise of curses and blows. In the midst of the disturbance Mrs. Runians came to the door with "Topsy," clinging to her skirts in terror.

"Kate, bring a light—a light! Quick!" she cried.

As the light glimmered in the hallway, old Runians's voice was heard above the din, and for a moment a writhing form was dimly seen above the heads of the crowd. Then it descended, and all was indistinct again—a swaying mass of struggling men.

All at once "Topsy" darted from Mrs. Runians's side into the frenzied group. In the uncertain light streaming from the hallway his quick eyes had caught the gleam of a knife. He flew at his father's throat, forcing his way into the middle of the throng no one knew how. The cobbler shook him off—there was a flash of steel through the air—a shrill cry—a sudden rush out into the snow, and the crowd parted leaving Joselyn gasping for breath pinioned in the strong arms of old Peter.

A trembling maid ran in with a lamp. Mrs. Runians snatched it from her and held it aloft. Then she reeled to the counter like one stabbed to the heart, powerless to cry out, her eyes distorted and vacant looking.

On the floor in a pool of blood, stabbed and trampled under foot, lay "Topsy." The knife intended for her husband had been sheathed in the boy's bosom. In a few moments Mrs. Runians recovered herself and was on her knees, with the poor pallid little face against her own, down which the tears were now streaming. Very gently was the frail little body carried into the kitchen and laid on the great deal table, and hushed and broken were the voices as the men gathered in the doorway. At last the doctor arrived, and, as the women were bathing the wound, "Topsy" opened his eyes and whispered—

"Is father—father?—"

He could not finish, and a spasm of pain shook the poor little frame as he sank back.

"God bless him! God bless him!" said Mrs. Runians through her sobs. She knew which father he meant. "Old Peter brought home an angel that winter's night and God has taken him again!"

DINING IN NORWAY.

DESCRIPTION OF A CHARACTERISTIC NORWEGIAN ENTERTAINMENT.

A neat maid, with a beautiful complexion, announced dinner, and Professor Heiberg offered me his seat at table, said, "Velkommen til bordet" (welcome to the board), a pretty way of expressing hospitality. The table was charmingly arranged with quaint old Norwegian silver and beautifully fine embroidered linen, says a writer in *Murray's Magazine*. The silver drinking-cups, of various shapes had usually little round tinkling things hanging from them as an ornamentation. These dangles give a light and pretty effect, and are quite old Norwegian style. Some of the spoons, with their quaintly twisted handles, were also very pretty. The menu was excellent, and in our honor had been composed of purely representative foods. First of all we had a delicious white soup made from cod, in which floated small balls of the fish, along with French beans that had previously been prepared by being soaked in vinegar and sugar. This soup sounds a curious melange, but it was really excellent. Next came a prepared fish served in a souffle dish, something like kegeree, only without any rice. A white sauce was handed with this, and the capers served separately. Wonderful to relate, we had fish knives—still a great luxury abroad. Cold ham, tongue and peas, prettily arranged together on one dish, were next handed round, and then came hot ptarmigan, which in its native land, well larded, and with a thick Norwegian sauce, is an excellent dish. With this we had compote of raspberries, red currant jelly, and preserved ginger. Multer are delicious. They are yellow fruit about the size of mulberries. They grow on low bushes in the Norwegian mountains—the fruit and flower bearing simultaneously. They are picked in October and preserved and served cold with cream. They have a slight flavor of pine trees, if such a thing is possible, but they are fascinating food. Two or three kinds of bread were eaten—the white rolls, black bread, which closely resembles German "pumpernickel," and "flat brod," a bread or cake made from rye, and first cousin to Scotch oat cake. Hock and claret were drunk during dinne

and sweet champagne served with the pudding and dessert. After dessert we had cheese, and the meal ended. "Skol" is really a Swedish word for drinking your health, and almost every time any one drank anything they smilingly skoled across the table to some one, who thereupon had to bow and drink, and bow again before putting down the glass. We, as guests, were skoled by every one in turn, until at last this health drinking became quite alarming, and we merely bowed in self-defence. With many thanks from our host for kindly dining with him, and many invitations for the future (a universally pretty form of politeness), our host offered me his arm and we walked back to the drawing-room. After a few minutes' conversation the gentlemen left us to smoke. Excellent coffee, with scalded cream, was then handed, accompanied by Swedish punch, a delicious although somewhat sweet liqueur. Our hostess produced a large, handsome cut-glass bottle of eau de cologne, to which her friends liberally helped themselves. Every one was kindness itself, and every one wanted to know if there was any service they could render us; if so, they were quite at our disposal, etc.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock, brant, grouse, partridge, rabbit, snipe, goose.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, carp, catfish, flounder, halibut, herrings, lobster, mackerel, mussels, oysters, pike, porgie, prawn, rockfish, salmon, sea bass, sturgeon, smelt, turtle, white fish, whiting.

VEGETABLES.—Artichokes, beets, beans, broccoli Brussels sprouts, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savoy, shallots, spinach, squash, tomatoes, turnips, watercress.

FRUITS.—Apples, bananas, blackberries, grapes, melons, oranges, peaches, pears, pineapples.

PRACTICAL RECIPES.

EEL SOUP.—Clean and cut into pieces three pounds of eels, measure them, and add two-thirds as much water as fish, then add a little mace, a sliced onion, a little whole pepper, some sweet herbs, and a crust from the top of a loaf of bread; cover closely, and stew until the fish begins to fall to pieces, then strain. Toast some slices of bread a good brown without burning, and cut them into dice; cut into pieces a piece of boiled carrot, put them in a tureen and pour in the soup. Boiling cream, slightly thickened with flour, may be added if liked.

STEWED BREAST OF MUTTON.—Bone and score the breast, season well with cayenne and black pepper and salt; put it in a pot, cover with broth or gravy and stew until tender, skimming off the grease as it rises. Slice a few gherkins and boil them up once with a table-spoonful of mushroom ketchup. Dish the mutton and pour the sauce over it.

BEETS.—Slice some cooked beets and heat the slices between two plates in the oven. Make a piquante sauce, boil some button onions, put them in the sauce, and pour it in the centre of a dish and serve with the beets around it.

OYSTER AND SCALLOPED PIE.—Take one pint of fresh scallops and wash them in cold water; drain, and dry them in a napkin. Cut a few slices of fat bacon in strips small enough to insert the ends in a larding-needle; lard the scallops with them, and dredge them slightly with flour. Select one quart of fat oysters; line a baking-dish with puff-paste; add the scallops and oysters in layers; season with salt, pepper, and a dash of mace. Divide an ounce of butter into little balls, roll them in flour, and put them between the layers; add the oyster liquor. Cover with a top crust; bake forty minutes in a moderate oven.

KIDNEY OMELET.—Cut a cooked veal kidney into small pieces, and warm them through, with some butter and chopped parsley, in a stewpan. Make an omelet, and before folding add the kidney; sprinkle with salt and pepper, fold and serve, garnished with parsley.

ALMOND CUSTARD.—Make a syrup of one and a half pounds of white sugar; clarify, boil and strain, and put the syrup on again to boil; add a table-spoonful of pounded sweet almonds, and when the syrup is cold pour in the yolks of twelve eggs, well beaten. With a spoon gently keep stirring on a slow fire until it thickens to the consistency of a boiled custard. Place then in individual glasses, and sprinkle powdered cinnamon on top.

COSMETICS.

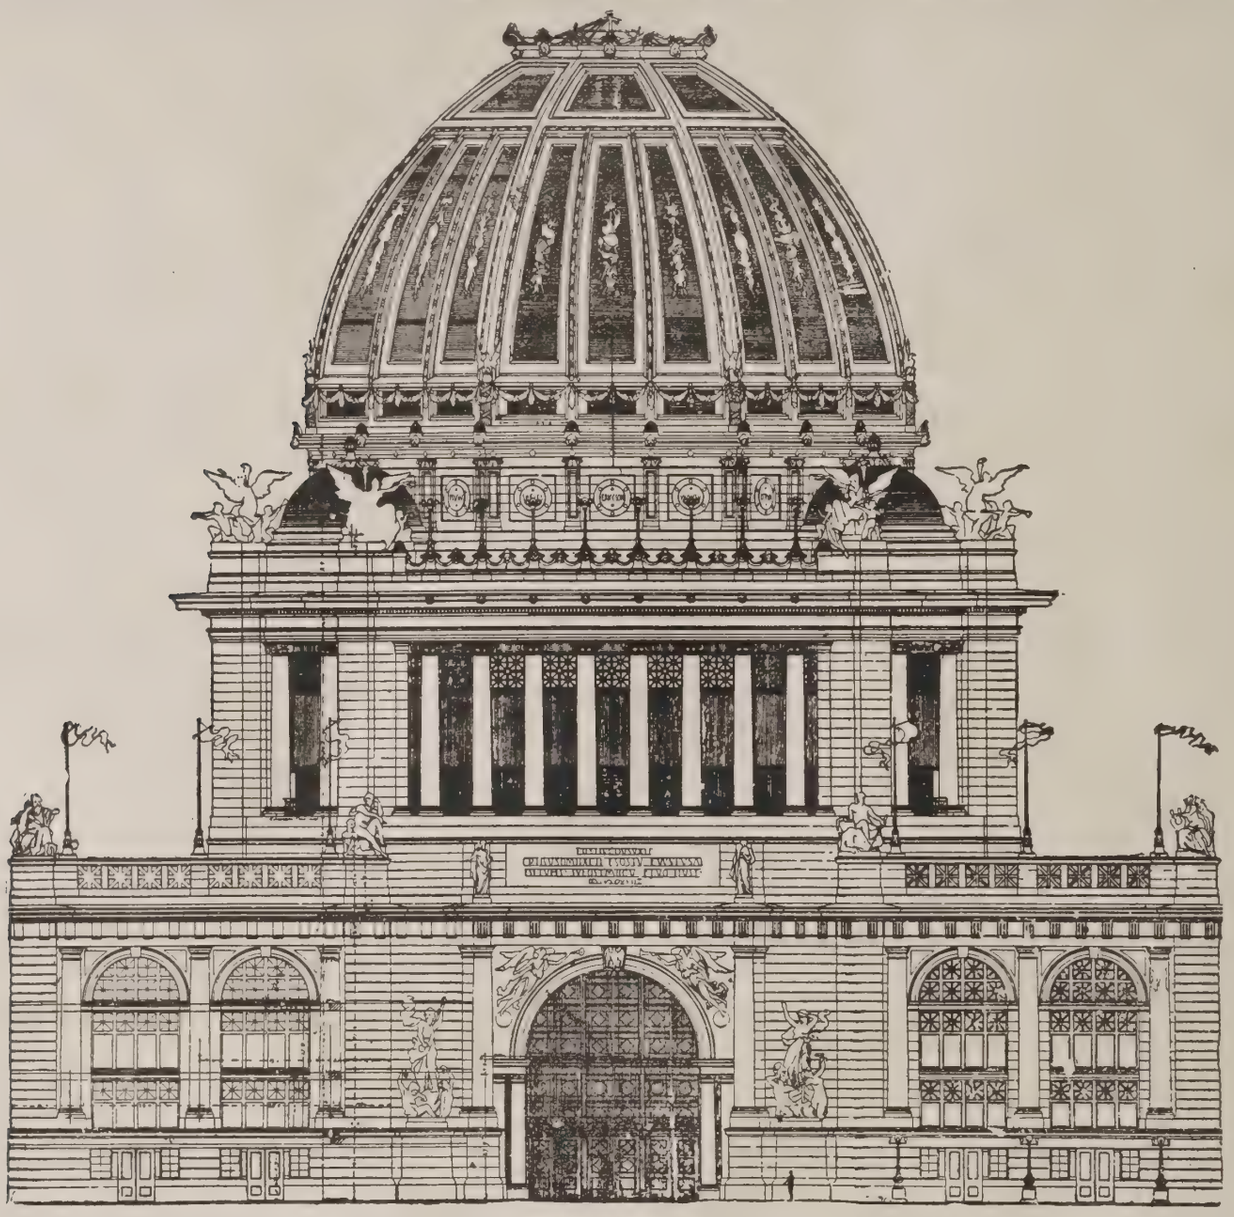
SOME SAFE SORTS FOR HOME MANUFACTURE.

The prevalent custom of facial high art decoration so marked at the present time, is not only a survival of barbarism, but has great antiquity of origin. Jezebel, you remember, painted her face and tired her head and looked out at a window; and the frivolous Roman Emperor Heliogabalus when he first entered Rome had "his eyebrows tinged black and his cheeks painted with artificial red and white;" and the first court present given to Catharine II. of Russia was a rouge pot, as we read in her memoirs, though the great Catherine was then only fifteen years old. Now, what woman has done through the centuries past she will continue to do through the eras to come, so let her do it wisely. Take a teaspoonful of the powder you use on your face, put it in a glass with the juice of a lemon. If effervescence follows, it is an infallible proof that the powder is dangerous and will injure the skin. If unsuccessful in obtaining pure face powder, then make your own after some of these simple formulas, always remembering that the very best and purest face powder is merely levigated talc passed through a silk sieve. Violet powder is made of wheat starch, in the proportion of six pounds to one pound of powdered orris, one-fourth ounce attar of lemon, one drachm each of bergamot and cloves. Rose face powder consists of rice starch, seven pounds; rose pink, half drachm; attar of roses and santal, two drachms each. The great actress, Vestris, always used a liquid preparation made of rose or orange flower water, one pint; oxide of bismuth, four ounces. These must be mixed by long trituration. A famous rouge called bloom of roses is made with half an ounce strong liquid ammonia, quarter ounce purest carmine, one pint rose water, and half an ounce of triple spirit of rose. Pour the ammonia on the carmine and allow it to remain four days, stirring occasionally; then add the rose water and spirit, and, after letting it stand for a week, decant the bloom of roses. A rose lip salve may be made of one-half pound of almond oil, two ounces of spermaceti and of wax and alkanet or blood root, and one-quarter ounce attar of roses. Place the wax, oil and alkanet root together in warm water, and when the first three are melted let them digest four to six hours on the alkanet root to extract its color. Strain through muslin and add the perfume just before the salve sets. Rusma, a mixture that removes undesirable hairs quickly, is made of three pounds best slaked lime to one-half pound of orpiment in powder; mix in a drum sieve, and keep well corked. To use, mix with water to a cream; apply to the objectionable hair until the skin smarts, scrape it away with a bone or ivory paper knife, wash the place carefully and apply cold cream. For the eyebrows take half an ounce Indian ink, rub down in a fine mortar, rub in half a pint of fine rose water, and after standing two or three days, with frequent stirring, it is ready to be applied with a fine camel's-hair brush. Sulphide of antimony, in which a blunt bodkin of ivory is wetted and drawn along the edges of the eyes beneath the eyelashes, adds much to the brilliancy of the eye and makes it seem larger. It is used in Egypt and Greece to-day, and is an old custom. Finally, the make-up, however pure, must be carefully washed off at night with pure soap and hot water, which may be followed by an application of cold cream or glycerine lotion. Cold cream contains one pound each of almond oil and of rose water, one ounce each of white wax and spermaceti, and one-half drachm of attar of roses. Boil the wax and spermaceti and oil in a double boiler of porcelain, and drop the rose water in, stirring constantly. The lotion contains one gallon orange flower water, eight ounces of glycerine, and one ounce borax. —*Sun.*

QUICK COOKERY.

A CHICKEN KILLED, CLEANED AND BROILED IN SIX MINUTES.

Prince Bismarck's old chef, who is now head cook in a big Berlin restaurant, recently won a novel bet, and gave a surprising exhibition of his mastery of the culinary art. He had wagered $25 that he could kill, clean, cook, and serve a chicken, all in six minutes. The wager was decided at night in the café of the restaurant in the presence of a big crowd. The cook appeared at nine o'clock on an improvised platform, upon which stood a gas cooking stove. He held a live chicken high above his head, and the fowl cackled loudly. One blow of a keen carver severed the head from the neck, and the cook began to pick the feathers with great swiftness. It took just one minute to get rid of every feather. In less than another minute the expert had opened and cleaned the fowl and had placed it upon a broiler on the gas stove. The cook busied himself at the broiler, seasoning the fowl as it cooked. It lacked just a second of the sixth minute when he stepped from the platform and served the chicken to the nearest guest, to great applause.



FOSSIL FLOUR.—A deposit of what is known as "fossil flour" has been recently discovered in Maine which will resist the action of acids, alkalies and oils, and is a remarkable non-conducter of heat.

ROTATION OF LABOR.—Dr. William A. Hammond says that even well-to-do Americans require more rest than any other people in the world, and get less. He thinks a human being should have a succession of labors and diversions as a farm has rotation of crops.

NEW EXPLOSIVE.—A French engineer has discovered a new explosive which he calls "fortis." He has asked for permission to undertake, at his own expense, the work of blowing up the famous rocks known as the "Iron Gates" of the Danube, which have hitherto resisted the action of all explosives.

NOVEL CUTWATER.—An English inventor has constructed a novel device to do away with the enormous pressure of water against the bows of ocean steamers. It consists of one or more screws on each side of the bow, which throws the water aside and creates a dry well in front of the vessel.

LAPSTREAK STAVES.—A new and improved barrel has been perfected. Each alternate stave is of a soft variety of wood and slightly thicker than their harder neighbors. When the hoops are driven down on to these barrels, the cracks which are noticed just where the staves are put together are closed up by the hard being pressed into the soft staves, and the thicker section of the latter causes them to overlap the edges of the hard staves. Thus the barrel is made tighter than the ordinary, and will be found much more durable.—*The Manufacturers' Gazette.*

THE COLUMBIAN ANNIVERSARY.

THE CHICAGO WORLD'S EXPOSITION OF 1893.

We present the readers of the AMERICAN ANALYST herewith an illustration of the Administration Building that is to grace the Columbian Exposition in Chicago two years hence, and we shall have occasion hereafter to publish further illustrations of that great enterprise. The foundation work of the Administration Building is all finished, and the material for the iron work of the edifice itself was expected to be received on the grounds by the middle of the present month. This building is the gem of all the architectural jewels of the exposition. Constructed of material to last but two years, it will cost $650,000. Although it covers a space but 250 feet square, yet it is one of the noblest achievements of modern architecture. It will occupy the most commanding position on the exposition grounds. The building consists of four pavilions, 84 feet square, one at each of the four angles of the square of the plan, and connected by a great central dome, 120 feet in diameter and 260 feet high. In the center of each facade is a recess, 93 feet wide, within which is a grand entrance to the building. The first story is in the Doric order, of heavy proportions. The second story, with its lofty colonnade, is in the Ionic order. Externally, the design is divided into three principal stages. The first stage consists of the four pavilions, corresponding in height with the buildings grouped about, which are 65 feet high. The second stage is of the same height and is a continuation of the central rotunda, which is 175 feet square. The third stage is the base of the great dome, 40 feet high and octagonal in form, and the dome itself, rising in graceful lines, richly ornamented with heavily moulded ribs and sculptured panels, and having a large glass skylight. The interior effects will be even more gorgeous than the exterior, resplendent with carvings, sculptures, and immense paintings. Aside from the cost of the great buildings, which will not be far from $7,000,000, the following are among the sums which have been, or will be, spent in preparation of the exposition grounds: Grading and filling, $450,000; landscape gardening, $323,500; viaducts and bridges, $125,000; piers, $70,000; waterway improvements, $225,000; railways, $500,000; steam plant, $800 000; electric lighting, $1,500,000; statuary, $100,000; vases, lamps, etc., $50,000; lake-front adornment, $200,000; water supply and sewerage, $600,000; other expenses, $1,000,000; total, $5,943,500. The total expense of organization, administration and operation of the exposition is estimated at nearly $5,000,000 This takes no account of the sums spent by the Government, the States, or foreign nations. The criticisms upon Chicago for seeking a loan of $5,000,000 from the National Government seem to be based chiefly upon a misapprehension of the causes which impelled that action. The scope of the fair has broadened. The loan is not to supplant but to supplement the $10,000,000 raised by the citizens and municipality of Chicago. Some idea of the immensity of the enterprise may be had if it is understood that the space set apart for exposition purposes is three times the area of the Paris grounds, or about the size of Central Park, New York. Japan is to be well represented at the Exposition. One plan is to export a number of dancing girls to give zest to Japanese cookery. Another contemplates a large Japanese garden, stocked with dwarf shrubs and other horticultural curiosities. Artificial flower making, basket weaving and other accomplishments in which Japanese excel, will also be represented. It was announced that the National Association of Woolen Manufacturers and the American Pottery Association would make splendid exhibits at the Exposition. The desire of both of the organizations, it appears, is to show foreign manufacturers of the same line of goods just what can be done in America. Special Commissioner Adler, at Constantinople, says that a Turkish exhibit is assured. It is understood that the Government of Columbia is preparing a photographic exhibit for the Exposition, which will include a complete collection of views illustrating types of people and their customs, habits and industries. Lieut. Scriven, the South American Commissioner, cabled that Costa Rica would appropriate $100,000 for exhibition purposes, instead of $50,000, as reported, and has asked for one acre of space for buildings and exhibits. Leigh Lynch asked for the privilege of exhibiting at the Exposition a Japanese village. On the display of this village Mr. Lynch said he was willing to expend $50,000, and the committee decided to recommend that 20,000 square feet of space on the Midway Plaisance be reserved for the exhibit.

DYSPEPSIA AND INDIGESTION.

Digestion is so beautiful a process, from a scientific point of view, that the stomach has been aptly called a laboratory. The assimilation of a hearty meal calls into operation a dozen different principles, each of interest and wondrous delicacy. In the stomach the gastric juices attack the food, converting all the meat substances and similar bodies into thick, rich liquids. This is absorbed, when it reaches the intestines, by a curious network which lines a large part of these organs, and which is the strongest, most durable and efficient filter known to science. It passes through a system of ducts which seem to exert some undiscovered chemical action, and is then pumped into the blood. In health this process is repeated from birth to death unnoticed, except in the painful sensation produced by hunger and the deep delight which waits an appetite and good digestion. It is self-regulating, working a maximum in the case of the day laborer and a minimum in the case of the invalid or the man of idle leisure. Ill-health affects these divine processes in many ways, but with one result. Indigestion or dyspepsia of some form is the sure consequence. It may be in the inactivity of the salivary glands, as occurs to habitual smokers and chewers of tobacco; it may be a temporary paralysis of the nerves which supply the assimilative centres, as happens to opium fiends and users of hasheesh; it may be the stopping or the lessening of the formation of pepsin, pancreatin, cholein, cholestein, or other principles essential to digestion; or it may be an intense local inflammation of the nerves, so as to produce the terrible agony we call gastralgia. It requires no further explanation to realize that any system which proposes to cure indigestion by giving those elements made lacking by the disease can only afford temporary relief, but cannot effect a permanent cure. What is needed is to rebuild the system and strengthen the great vital functions so as to do away with the symptoms we call disease, and which too often we fancy to be the real ailment from which we suffer. It is a simple process, neither costly nor painful. All that is required is to keep the skin thoroughly clean and the bowels well opened; to exercise and be as much as possible in the sunlight and fresh air; to maintain regular hours and early ones if possible; to associate with pleasant companions, and to use with religious regularity Ayer's Sarsaparilla. This superb preparation does not affect the stomach directly, unless through its pleasant flavor it acts as an appetizer. But after it enters the system it purifies the blood, tones up and stimulates every organ of the body, and in so doing restores every process to its normal activity. Where indigestion is of very long standing, it will require some time for the sarsaparilla to produce a real cure. When it is acute or recent, the famous compound will dispell the trouble in a few weeks. Taken whenever the organization demands it, it will absolutely prevent indigestion or dyspepsia in any one of their protean forms. To the scientific mind, it is the only medicinal substance known which will put the digestive organs into complete health.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Relieves indigestion, dyspepsia, etc. Dr. W. E. Crane, Mitchell, Dak., says: "It has proven almost a specific for this disorder; it checks the vomiting, restores the appetite, and, at the same time allays fear of impending dissolution, that is so common to heavy drinkers."

A NEW WINTER RESORT.

The Arrowhead Hot Springs are situated in San Bernardino County, California. They are a mountain resort 2,000 feet above sea level, and possess all the advantages of the justly celebrated salubrious climate of California, a beautiful location and valuable hygienic resources. A fine hotel has been erected containing every modern improvement, and is managed by Dr. H. C. Royer, which assures good accommodation, fine table, and at moderate cost. This resort being on the Southern Pacific Railroad, is easily reached. By addressing Dr. Royer, at Arrowhead, Cal., circulars giving full particulars may be had.

ARMOUR'S PEPSIN.

The editor of the *National Druggist*, who is one of our best microscopists, speaks as follows of Armour's Pepsin: After thoroughly studying the matter, and employing the very best pharmaceutical and chemical talent, a short time ago they commenced to extract the digestive ferments from the stomach and pancreas of the slaughtered animals, and to manufacture Pepsin and Pancreatin on a scale never before attempted in the world's history. They then commenced to make a market for their products, and, by judicious sampling of physicians and wide advertising, they have created a demand for them among the medical profession. The writer has received samples of the pepsins made by Armour & Co., and can say of his own knowledge that they are the most excellent, being freer from odor than any other in the market, and of a high digestive value.

A STOVE WITHOUT A CHIMNEY.

When one is told that a stove may be bought which requires no chimney, and yet makes no smoke, nor does it give off any gas or unpleasant smell. It is the "Sestalit," which uses a fuel chemically prepared from wood. The stove is a common cylinder of Russia iron or japanned iron, containing a kettle with a grate bottom, in which the fuel is placed. Underneath is a

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

drawer to receive the ashes, and this drawer also contains a circular receptacle to hold an asbestos sponge, which is saturated with alcohol and lighted to ignite the fuel above. The stove, which weighs only about twenty pounds, is provided with a bail or handle by which it can be carried from room to room when lighted. The fuel comes in square tubes, ten of which make a light charge for the fire. About twenty-five weigh two pounds, and will last ten hours. The fuel costs five cents per pound. The stove may be seen in operation at 19 Park Place and at 21 East 42d Street.

FOREIGN WHEAT.—Seven out of every eight loaves of bread eaten in London are made from foreign wheat.

SMOKELESS FIRING.—A Limoges firm has introduced a new problem of firing porcelain by means of a very pure heat without smoke or fumes.

INDESTRUCTIBLE ROPE.—In Southern Arizona there grows a plant from which rope and twine that will almost never wear out can be made. It is the mescal plant. But very little of this rope has been made thus far

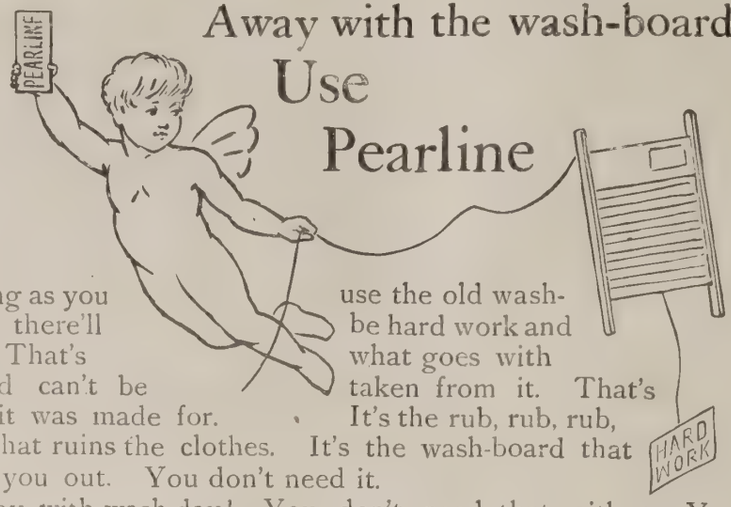
Luncheon Muffins.

BY MARIA PARLOA.

For one dozen muffins use one pint of flour, a generous half pint of milk, two teaspoonfuls of Cleveland's Baking Powder, half a teaspoonful of salt, two tablespoonfuls of sugar, three tablespoonfuls of butter and two eggs. Mix the dry ingredients together and rub through a sieve. Melt the butter. Beat the eggs till light and add the milk to them. Add this mixture to the dry ingredients; then stir in the melted butter. Beat the batter vigorously for a few seconds and then put in buttered muffin pans and bake for about twenty minutes in a quick oven.—(Copyright, 1891, by Cleveland Baking Powder Co.)



Use only Cleveland's baking powder, the proportions are made for that.

Cleveland's Superior Baking Powder is perfectly wholesome. It leavens most and leavens best.

Away with the wash-board
Use Pearline

As long as you use the old wash-board there'll be hard work and waste. That's what goes with it, and can't be taken from it. That's what it was made for. It's the rub, rub, rub, on it that ruins the clothes. It's the wash-board that wears you out. You don't need it.

Away with wash-day! You don't need that, either. You don't set apart a day for washing the dishes. Wash the clothes in the same way, with no more work, a few at a time.

But you'll have to use *Pearline* to do it. *Pearline* only can rid you of wash-board and hard work; with it you can do your washing when you like. And you can do it safely, too. Directions on every package.

Away with the peddlers and prize givers, who say their imitations are "as good as" or "same as" Pearline—IT'S FALSE—Pearline is never peddled and has no equal. Sold by all grocers. 246 JAMES PYLE, New York.

TOO TRUE.—"Did you see the notice I gave you?" said the editor to the grocer, "Yes; and I don't want another. The man who says I've got plenty of sand, the milk I sell is of the first water, and my butter is the strongest in the market, may mean well, but he is not the man I want to flatter me the second time."

SALT LAKE.—Great Salt Lake in Utah has been computed to contain, if its water were evaporated, 193,000,000,000 cubic feet of salt, or 13,510,000 000,000 pounds. Spread this out a foot in depth and a quarter of a mile wide, and it will make a band around the earth at its greatest circumference. Load it in railway cars, and it will take 675,500,000 of them to carry it.

NEW PROCESS.—Charles Henderson, of Titusville, Pa., has made an important discovery, which he claims will reduce the cost of steel tools from 40 cents to 4 and 5 cents a pound. This process makes it possible to use the ordinary soft machine-steel for all kinds of tools, rendering them equal to high-grade silver-steel for all kinds of work. There is no breaking or flaw in the tempering.

CHEAP AND TASTEFUL.—For bedroom papers less expensive ones can be used than for halls, parlors, and drawing-rooms. One very dainty, pretty pattern has a delicate gray ground on which runs a pattern of wild flowers in "baby" blue. A narrow frieze of "baby" blue is at top and bottom, and a delicate ceiling pattern in "baby" blue and gray makes a charming little chamber and is inexpensive.

A ROLAND FOR AN OLIVER.—While cross-examining Dr. Warren, a New York counsel declared that doctors ought to be able to give an opinion of a disease without making mistakes. "They make fewer mistakes than the lawyers," responded the physician. "That is not true," said the counselor: "But doctor's mistakes are buried six feet under ground, a lawyer's are not." "No," replied Warren, "but sometimes hung as many feet above the ground.

FREAKS' JUBILEE.—At the Register's office in South Shields, England, on April 26, a girl only 32 inches high was married to professor Hedley, 6 feet 1 inch high. Humbert, the man without arms, gave the bride away, signing the certificate by holding the pen between his teeth. The bridesmaid was Miss Nina, the American giantess, who weighs 616 pounds. The best man was Capt. Dallis, 7 feet 10 inches in height. Gen. Metilone, 29 inches high, was one of the wedding party. All were connected with a traveling circus going through the country.

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

THE QUEEN'S PRIZE SCHOOL OF HISTORY.

About two years ago the publishers of THE CANADIAN QUEEN added what has proven to be a very popular and successful feature to their publication in establishing their Prize History School. It has offered competitive examinations in English, Canadian and American History, giving valuable rewards to those making the most correct answers. During this time there have been added the names of over forty thousand new subscribers to their books. Rewards have been made by THE QUEEN which have cost them in cash over ten thousand dollars. THE QUEEN'S Prize School of History has received the sanction and support of the clergy, press, and, in fact, of the best people of the Dominion of Canada. The following, taken from a leading daily newspaper, expresses an opinion which is universal:

A HANDSOME PRIZE.

AN EVIDENCE OF WHAT A GENUINE MAGAZINE COMPETITION OFFERS.

"On Friday there arrived from Toronto, for Miss M. Hora, a handsome Shetland pony, harness and cart, being the first award in the Royal Quilt Competition of THE CANADIAN QUEEN magazine. It attests the genuine nature of the magazine's contests by its excellent condition and value. THE QUEEN has frequent competitions and has made innumerable awards, displaying a generosity quite surprising to those who have had experience of the limited field for Canadian journalistic enterprise. But THE QUEEN has been a success as a business venture from the start, and is growing in literary excellence steadily. It covers the field of fashion, as well as light reading; talks to the household, the young, and, indeed, all home classes. The competitions have been used to assist the introduction of the magazine, for where it is introduced it is quite certain to remain a monthly guest. The leading prizes have been made, as instance this latest to Kingston, while many smaller prizes have rewarded the moderately successful among competitors. THE CANADIAN QUEEN is truly royal in its ways."—*The (Kingston, Ont.) Daily British Whig*, June 27th, 1891.

QUESTIONS IN AMERICAN HISTORY.

1.—Give the names of the early navigators who it is claimed by historians first discovered America.
2.—From whom has America taken its name?
3.—What class and nationality first settled Virginia? New York? Massachusetts? Pennsylvania? Maryland?
4.—What action did the Continental Congress of 1774 take and what was the result of that action?
5.—What was the first battle fought in the War of the Revolution?
6.—What nation rendered the Americans great assistance in the War of the Revolution?
7.—Give the names of the committee appointed to draft the famous Declaration of Independence.
8.—What was the date of the signing of the United States Constitution?
9.—After becoming a nation and before the great Civil War, what were the principal conflicts which engaged the Americans?
10.—What was the direct cause of the Civil War? What Generals of the Northern Army have occupied executive positions under the Federal Government since the closing of the War? Who was Commander-in-Chief and who were the principal Generals of the Confederate Army during the struggle?
11.—How long did this War last and what is the computed loss of life?
12.—What can be said to day of the United States as a nation?

To the *First* gentleman sending the correct answers to the above questions in American History the publishers of THE QUEEN will present "**Majestic**" acknowledged the **Handsomest and Finest Riding Horse in Ontario.** ("Majestic" is sixteen hands high, thoroughbred, seven years old, and valued at $350.00.) To the *First* lady the publishers of THE QUEEN will present an elegant **Jacket of Genuine Alaska Seal** to be made according to the measurement supplied by the winner. To the *First* boy under sixteen years of age the publishers of THE QUEEN will present a **Little Giant Safety Bicycle** valued at $75.00. To the *First* girl under sixteen years of age the publishers of THE QUEEN will present an elegant **Music Box,** playing twenty tunes, finely finished and valued at $55.00.

To the gentleman from whom the *Last* correct answers are received before the close of this Competition, the publishers of THE QUEEN will present a **First Cabin Passage to Europe and Return** and **$200 in Gold** for expenses. This trip can be taken by the winner any time before October 1st, 1892. To the lady from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Pony, Cart and Harness.** To the boy under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Solid Gold Watch** containing one of the best American movements, and valued at $75.00. To the girl under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present an elegant **Solid Gold Watch,** containing one of the best American movements, and valued at $65.00.

ADDITIONAL PRIZES IN ORDER OF MERIT: Silver Tea Services, Ladies' Gold Watches, Silk Dress Patterns, French Mantel Clocks, Portiere Curtains, Toilet Cases, Manicure Sets, and many other useful and valuable articles.

The object of the publishers in offering these liberal prizes is to introduce THE QUEEN Magazine into **new** homes. Answers must be mailed *on or before* November 10th, 1891, and must be accompanied by $1.00 for one year's subscription to THE CANADIAN QUEEN. Prizes awarded to subscribers residing in the United States will be shipped to them **free of duty.** The distribution of awards is in the hands of disinterested persons, and decisions will be based on the correctness of answers. Use your own language in wording the answers. No corrections can be made after your answers are mailed. THE QUEEN is a large, forty-eight page family magazine, especially interesting to ladies and children, and visits regularly **over one hundred thousand of the best homes** in Canada and the United States. The awards in THE QUEEN'S Prize School of History are made strictly with regard to merit, without partiality to persons or locality. The decisions must be accepted as final. If you have never seen a copy of THE QUEEN send six U. S. two cent stamps and receive a late number, post paid, containing letters from those who have received rewards in previous contests.
Address THE CANADIAN QUEEN, PRIZE SCHOOL OF HISTORY, 58 BAY STREET, TORONTO, CANADA.

GLENN'S SULPHUR SOAP.

ADULTERATED LIQUORS.

In the third biennial report of the Dairy Commissioners of Minnesota, the character of the alcoholic liquors that had been brought to their observation is discussed at length, and an abstract of their conclusions will be found of interest. That there are extensive adulterations and sophistications of wines practiced in the United States, no one will question. It must not be assumed, however, that all wines upon the American market are necessarily of this character, since there is not a particle of evidence to support such a claim. There are sections of this country that produce wines of excellent quality, and there is no evidence on record to show that these native wines are adulterated or sophisticated during their manufacture or before their sale. Chemical analysis of samples of California wine show them to agree closely to the accepted standards, and give no evidence of being other than pure and of good quality. In the examination of beers, it was found that the principal sophistication consisted in the use of cheaper substitute for malt, either in the form of other grain: unmalted barley mixed with the malt, rice flour or glucose. The principal effect of these is the production of a beer which is poorer in albuminoids and phosphates, and is, consequently, less nutritious than it should be. As substitutes for hop bitters, the report mentions picrotoxin and picric acid, but regards their use as rare. Of preservatives, salicylic acid seemed to be the most popular, as nearly one-fourth of the samples examined contained it. No case of direct adulteration was discovered, all variations from the normal article being some fault of curing or clearing, and the above-mentioned substitutes in the manufacture. The report deals harshly with foreign brandy. Most of the brandy imported to this country from France is of inferior quality, frequently by reason of absolute sophistication. The term "brandy" seems to be no longer applied to a spirit produced by fermentation of grapes, but to a complex mixture of alcohol derived from grain, potato or beet-root refuse. Potato and beet-root spirit is shipped into France from Germany and the United States. These are the most objectionable of all spirits, and hence brandy made from them is objectionable. They are flavored and colored, branded and labeled, and shipped to America in large quantities. Physicians frequently order brandy, while when they do so they can confidently expect that one of these mixtures will be supplied to the patient. The report calls attention to the fact, further, that not one of the samples examined by the Dairy Commissioners of New Jersey in 1888 came up to the pharmacopœial standard. Most of the native brandies are genuine, although they have not been aged enough to make them bland and palatable, and many of them contain fusel oil. The most of the samples of whiskey examined were deficient in alcoholic strength, and contained too much solid matter in the form of burnt sugar, glycerine, etc. Two out of fifteen samples examined were not whiskey, but artificial mixtures. Those that were genuine were not properly mellowed by age, and were, therefore, harsh, irritating, and consequently disturb the digestion.

GERMAN ELECTRICIANS.

Germany seems to stand at the front in electrical science. Mr. J. Allen Hornsby, an electrical expert, and one of the World's Fair Commissioners to Kaiserhof, said before he left Berlin last week for St. Petersburg: "Germany is ahead of the United States in the artistic lighting of theatres and residences, and also in the manufacture of dynamos, which get light and power simultaneously from the same alternating machine. It is ahead also in having brought a definite issue in practice, the three-phase alternating system of transmission. Europe is ahead of the United States in almost all directions of electrical science, but America is far away ahead in practice. In America we use every invention our people make. While here, I have been forced to use a candle in the finest hotels, though there is on exhibition a better light, more beautiful and cheaper than anything we know of in America."

PRICKING A HUMBUG.

It is comforting to occasionally meet with a daily newspaper editor who prefers common sense and reason to mere sensationalism. The writer who penned the editorial article published in *The Recorder* of October 19th on the "sure cure" claim that has been so loudly vaunted in behalf of the absurd bi-chloride of gold treatment of dipsomania—a theory about as tenable as that of the Keely motor—is entitled to high praise for being independent enough to see things from a standpoint separate from the advertising department of his concern. He said: "A comparatively unknown doctor, in a small town out West, has suddenly attained an almost National notoriety, and has received an immense amount of gratuitous advertising in newspapers throughout the country, as the discoverer of a new cure for dipsomania. All such cures—like Pasteur's for hydrophobia, Koch's for consumption, and now Keeley's for drunkenness—are at first generally and even jubilantly accepted by the always generous and confiding public. But by medical men these alleged discoveries in their own domain of experience and practice are treated with distrust, or even disdain, until searching scientific investigation shall prove that the new formula has a basis or ingredients which naturally must, not may, effect the cure for which it is prescribed. From such scientific investigation the discoverer of the new cure for dipsomania shrinks. This unwillingness to make public, for the acceptance of his professional brethren, a recipe which, if it will do what is claimed for it, would be a priceless addition to our present pharmacopœia, and a blessing to the whole human race, is open to two well warranted suspicions. It either is something that will not bear close analysis, or, in other words, is what is contemptuously called a 'quack medicine,' or the discoverer is much more anxious to make money from his own administration of his already well patronized remedy, than he is to benefit his fellow men by making universal what will afford relief to a large and unfortunate class of sufferers. This much is told—that the basis of the new cure is bi-chloride of gold. This already has suggested bi-chloride of nickel as a cure for love! and, possibly, a tendency to gout might be restrained by limiting the gourmand to American tin plates! But while the patients are under the bi-chloride treatment they vigorously abstain from alcohol. It does not seem to have occurred to any of these patients, who are paying roundly for bi-chloride and board, that, by refraining from the use of alcohol, the treatment would be just as effective if the abstinence were accompanied by daily doses of buttermilk."

JONATHAN'S DAUGHTERS.

MAX O'RELL'S CRITICISM OF THE TYPICAL AMERICAN LADY.

Among the most keenly observant critics of national peculiarities of the present day is M. Paul Blouet, whose amusing volumes on English and American society have been widely read and laughed over. M. Blouet is more familiarly known by his assumed name of "Max O'Rell." He is a Frenchman, with the lively wit and the epigrammatic instinct that are so characteristic of the cultivated men of his race, and he is furthermore a gentleman capable of being witty and satirical without being brutal. He writes in French, having only an imperfect acquaintance with the English language, but his wife who is an English woman of brilliant wit and culture translates his productions and gives them the graceful setting with which we are all familiar. Since M. Blouet's last visit to the United States he has published a book on "Brother Jonathan" and a paper in the *North American Review* (May, 1890), on "The Typical American." In the latter he denied the existence of "typical" American gentlemen, that class being identical in every civilized country, but in the American lady he finds a degree of individuality that surprises himself. On the latter theme he discourses at length in the *Strand Magazine* (London, November, 1891), and we have taken the following extracts from his sketch for the edification of the readers of the AMERICAN ANALYST:

The American lady, in my eyes, is a distinct type; her charms is distinct from the charm of any European lady, and is certainly equal in extent to any. Two traits struck me very forcibly in her, and to the first of these I think she owes a great part of her success. They are, naturalness, or utter absence of affectation, and—shall I say it?—a lurking contempt for man. Not a militant contempt, not a loud contempt, but a quiet, queenly, benevolent contempt. I talked about her owing her success to the first of these; but who shall say whether her triumphant progress has not been greatly due to the second?

I have often tried to explain to myself this gentle contempt of American ladies for their male sex; for, contrasting it with the devotion, the lovely devotion of Jonathan to his womankind, it is a curious enigma. Have I found the solution at last? Does it begin at school? In American schools, boys and girls, from the age of five, follow the same path to learning, and side by side on the same benches. Moreover, the girls prove themselves thoroughly capable of keeping pace with the boys. Is it not possible that the girls, as they watched the performances of the boys in the study, have learnt to say: "Is that all?" while the young lords of creation, as they looked on at what "those girls" can do, have been fain to exclaim: "Who would have thought it?" And does not this explain the two attitudes: the great respect of men for women, and the mild contempt of women for men?

* * * * * *

When I was in New York, and had time to saunter about, I would go up Broadway, and wait until a car, well crammed with people, came along. Then I would jump on board, and stand near the door. Whenever a man wanted to get out, he would say to me, "Please," or "Excuse me," or just touch me lightly to warn me that I stood in his way. But the ladies! Oh, the ladies! Why, it was simply lovely. They would just push me away with the tips of their fingers, and turn up such disgusting and haughty noses! You would have imagined it was a heap of dirty rubbish in their way.

* * * * * *

Just as one of the hardest ways of earning a living is to be a middle-class English wife, so one of the loveliest sinecures in the world is to be an American lady. A small, sometimes no, family to bring up; very often no house to keep; three months' holiday in Europe; a devoted, hardworking husband ever ready to pet her, worship her, and supply the wherewith; an education that enables her to enjoy all the intellectual pleasures of life; a charming naturalness of manner; a freedom from conventionality; a bold picturesqueness of speech; a native brilliancy; all combine to make her a distinct type, and the queen of her sex.

* * * * * *

When a Frenchman and a Frenchwoman converse together, they can seldom forget that one is a man and the other a woman. It does not prove that a Frenchwoman must necessarily be, and is, affected in her relations with men; but it explains why she does not feel, as the American woman does, that a man and a woman can enjoy a *tete-a-tete* free from all those commonplace flatteries, compliments, and platitudes that badly understood gallantry suggests. Many American ladies have made me forget, by the easiness of their manner, and the charm and naturalness of their conversation, that I was speaking with women, and with lovely ones too. This I could never have forgotten in the company of French ladies.

On account of this feeling, and perhaps also of the difference which exists between the education received by a man and that received by a woman in France, the conversation will always be on some light topics, literary, artistic, dramatic, social, or other. Indeed, it would be most unbecoming for a man to start a very serious subject of conversation with a French lady to whom he had just been introduced. He would be taken for a pedant or a man of bad breeding.

In America, men and women receive practically the same education, and this of course enlarges the circle of conversational topics between the sexes. I shall always remember a beautiful American girl, not more than twenty years of age, to whom I was once introduced in a New York drawing-room, as she was giving to a lady sitting next to her a most minute description of the latest bonnet invented in Paris, and who, turning towards me, asked me point blank if I had read M. Ernest Renan's last book, "The History of the People of Israel." Well, I had not. I had to confess that I had not yet had time to read it. But she had, and she gave me, without the remotest touch of affectation or pedantry, a most interesting, detailed, and learned analysis of that remarkable book, almost in one breadth with the description of the Paris bonnet. I related this incident in "Jonathan and his Continent." On reading it, some of my countrymen, critics and others exclaimed: "We imagine the fair American girl wore a pair of gold spectacles."

"No, my dear compatriots, nothing of the sort. No gold spectacles, no guy. It was a beautiful girl, dressed with the most exquisite taste and care, and most charming and womanly."

An American woman, however learned she may be, is a sound politician, and she knows that the best thing she can make of herself is a woman, and she remains a woman. She will always make herself as attractive as she possibly can, not to please men, to please herself. If in a French drawing-room I were to remark to a lady how clever some woman in the room looked, she would probably closely examine that woman's dress to find out what I thought was wrong about it. It would probably be the same in England, but not in America.

A Frenchwoman will seldom be jealous of another woman's cleverness. She will far more readily forgive her this quality than beauty. "Oh! how I should like to be a man!" once exclaimed a French lady in my presence. An American lady would probably have said to her. "My dear, you are ever so much better as you are!"

Of all the ladies I have met, I have no hesitation in declaring that the American ones are the least affected. With them, I repeat it, I feel at ease as I do with no other women in the world.

With whom but an *Americaine* would the following little scene have been possible?

It was on a Friday afternoon in Boston, the reception-day of Mrs. X., an old friend of my wife and myself. I thought I would call upon her early in the afternoon, before the crowd of visitors had begun to arrive. I went to her house at half-past three. Mrs. X. received me in the drawing-room, and we soon were talking on the one hundred and one topics that old friends have on their tongue tips. Presently the conversation fell on love and lovers. Mrs. X. drew her chair up a little nearer to the fire, put the toes of her little slippers on the fender-stool, and with a charmingly confidential, but perfectly natural, manner, said:

"You are married, and love your wife; I am married, and love my husband; we are both artists, let's have our say out."

And we proceeded to have our say out.

But, lo! all at once I noticed about half an inch of the seam of her black silk bodice was unsewn. We men, when we see a lady with something awry in her toilette, how often do we long to say to her: "Excuse me, Madam, but perhaps you don't know that you have a hairpin sticking out two inches just behind your ear," or, "Pardon me, Miss, I'm a married man, there is something wrong just under your waist belt."

But we dare not say so. We are afraid we shall be told to mind our own business.

Now, I felt for Mrs. X., who was just going to receive a crowd of callers, with a little rent in one of her bodice seams, and tried to persuade myself to be brave, and tell her of it. Yet I hesitated. People take things so differently. The conversation went on unflaggingly. More than once I had started a little cough, and was on the point of—but my courage failed. The clock struck half-past four. I could not stand it any longer.

"Mrs. X," said I, all in a breath, "you are married, and love your husband; I am married, and love my wife; we are both artists; there is a little bit of seam come unsewn just there by your left arm, run and get it sewn up!'

The peals of laughter that I heard going on upstairs while the damage was being repaired, proved to me that there was no resentment to be feared; but, on the contrary, that I had earned the gratitude of Mrs. X.

* * * * * *

Inquisitiveness, I have said, is a characteristic feature of American men; but I imagine that this feature is also to be found in the daughters of the Great Republic.

During my second visit to the States, it amused me to notice that the Americans to whom I had the pleasure of being introduced, refrained from asking me what I thought of America, but they invariably inquired if the impressions of my first visit were confirmed.

One afternoon, at an "At Home" in Boston, I met a lady from New York who asked me a most extraordinary question.

"I have read 'Jonathan and his Continent,'" she said to me. "I suppose that is a book of impressions written for publication. But now, tell me *en confidence*, what do you think of us?"

"Is there anything in that book," I replied, which can make you suppose that it is not the faithful expression of what I think of America and the Americans?"

"Well," she said, "it is so complimentary, taken altogether, that I must confess I had a lurking suspicion of your having purposely flattered us, and indulged our national weakness for hearing ourselves

praised, so as to make sure of a warm reception for your book."

"No doubt," I ventured, "by writing a flattering book on any country, you would greatly increase your chance of a large sale in that country; but, on the other hand, you may write an abusive book on any country, and score a great success among that nation's neighbors. For my part, I have always gone my own quiet way, philosophizing rather than opiniating, and when I write, it is not with the aim of pleasing any particular public. I note down what I see, say what I think, and people may read me or not, just as they please. But I think I may boast, however, that my pen is never bitter, and I do not care to criticise unless I feel a certain amount of sympathy with the subject of my criticism. If I felt that I must honestly say hard things of people, I would abstain altogether."

"Now," said my fair questioner, "how is it that you have so little to say about our Fifth Avenue folks? Is it because you have seen very little of them, or is it because you could only have said hard things of them?"

"On the contrary," I replied, "I saw a good deal of them, but what I saw showed me that to describe them would be only to describe polite society, as it exists in London and elsewhere. Society gossip is not in my line, boudoir and club smoking-room scandal has no charm for me. Fifth Avenue resembles too much Mayfair and Belgravia to make criticism of it worth attempting."

I knew this answer would have the effect of putting me into the lady's good graces at once, and I was not disappointed. She accorded to me her sweetest smile, as I bowed to her, to go and be introduced to another lady by the mistress of the house.

The next lady was a Bostonian. I had to explain to her why I had not spoken of Beacon Street people, using the same argument as in the case of Fifth Avenue society, and with the same success.

* * * * * *

At the same "At Home," I had the pleasure of meeting Mrs. Blank, whom I had met many times in London and Paris.

She is one of the crowd of pretty and clever women whom America sends to brighten up European society, and who reappear both in London and Paris with the regularity of the swallows. You meet them everywhere, and conclude that they must be married, since they are styled Mrs., and not Miss. But whether they are wives, widows, or *divorcees*, you rarely think of inquiring, and you may enjoy their acquaintance, and even their friendship, for years, without knowing whether they have a living lord or not.

Mrs. Blank, as I say, is a most fascinating specimen of America's daughters, and that day in Boston I found that Mr. Blank was also very much alive, but the companions of his joys and sorrows were the telephone and the ticker; in fact, it is, thanks to his devotion, to these that the wife of his bosom is able to adorn European society during every recurring season.

American women have such love for independence and freedom that their visits to Europe could not arouse suspicion, even in the most malicious. But, nevertheless, I was glad to have heard of Mr. Blank, because it is comfortable to have one's mind at rest on these subjects. Up to now, whenever I had been asked, as sometimes happened, though seldom: "Who is Mr. Blank, and where is he?" I had always answered: "Last puzzle out!"

The freedom enjoyed by American women has enabled them to mould themselves in their own fashion. They do not copy any other women, they are original. I can recognize an American woman without hearing her speak. You have only to see her enter a room or car, and you know her for Jonathan's daughter. Married or unmarried, her air is full of assurance, of a self-possession that never fails her. And when she looks at you, or talks to you, her eyes express the same calm consciousness of her worth.

Would you have a fair illustration of the respective positions of women in France, in England, and in America?

Go to a hotel, and watch the arrival of couples in the dining-rooms.

Now, don't go to the Louvre, the Grand Hotel, or the Bristol, in Paris. Don't go to Claridge's, the Savoy, the Victoria, or the Metropole, in London. Don't go to Delmonico's, in New York, or the Thorndyke, in Boston, because in all these hotels you will probably run the risk of seeing all behave alike. Go elsewhere, and, I say, watch.

In France you will see Monsieur and Madame arrive together, walk abreast towards the table assigned to them, very often arm-in-arm, talking and smiling at each other—though married. Equal footing.

In England you will see John Bull leading the way. He does not like to be seen eating in public, and thinks it very hard that he should not have the dining-room all to himself. So he enters, with his hands in his pockets, looking askance at everybody right and left. Then, meek and demure, with her eyes cast down, follows Mrs. John Bull.

But in America! Oh, in America, behold the dignified, nay, the majestic entry of Mrs. Jonathan—a perfect queen going towards her throne, bestowing a glance on her subjects right and left—and Jonathan behind!

They say in France that Paris is the paradise of women. If so, there is a more blissful place than paradise; there is another word to invent to give an idea of the social position enjoyed by American ladies.

If I had to be born again, and I might choose my sex and my birthplace, I would shout at the top of my voice:

"Oh, make me an American woman!"

HAIRSPRINGS.

SOME PRACTICAL VIEWS ON THE MAKING OF WATCH SPRINGS.

There is not one watchmaker in a hundred who can fit a hairspring properly, and not one in fifty who knows a correct one when he sees it, says a writer in an eastern paper. The above sentiment expressed by a recognized authority—though, no doubt, too sweeping, still indicates such a lack of information as to furnish plenty of excuse for an essay on the hairspring—the soul of the watch, which has been the subject of the study of the philosopher and experiment of the mechanic, as well as the theme of the essayist, ever since the days of Dr. Hooke. Restricted, as this essay must be, it cannot be expected to be an exhaustive treatise on such a subject as this; but should, at least, contain the greatest possible "pith and point," hence the author will try to suggest the essentials in an essay of convenient length, believing the intelligent and painstaking workman can elaborate on the same, and probably be more benefited than by the tedious perusal of a longer article, burdened with intricate causes and effects, fine spun articles, theories and difficult calculations. Hairsprings are generally made of steel, either left soft or hardened and tempered; the latter should always be used in preference to the former, as being so much superior; the difference in cost should not be allowed to count. Springs have also been made of gold and other non-magnetic material. Steel springs are easily and cheaply produced, but are liable to rust, especially the soft ones, which also cannot be depended upon to retain their shape or elasticity well; even hardened and tempered steel springs are known to change somewhat from long use, and both are subject to magnetic influence. Gold is, of coure, non-magnetic, does not rust and may be made quite elastic, but is too heavy. Some other "non-magnetic" hairsprings, which will not corrode, are coming into use, and though regarded by some as only a caprice of the moment, may shortly demand a conspicuous place in all well-regulated material cabinets. The making of springs from the raw material may be passed over in silence, as there is no excuse for the watchmaker of to-day attempting it. Though new hairsprngs are but seldom required, as compared with mainsprings and other repairs, yet on account of the extreme exactness required, it is necessary to be prepared with just the right thing, as depending on the material dealer at the last moment is apt to result in using something about right, or which can be made to do, but will be found invariably disappointing in the end; hence it will pay to keep a complete assortment of various strengths and diameters, properly assorted, in order to save time and do correct work. Springs made of wire, rather wide than thick, are to be preferred, they being the most elastic; and whether of steel or other material, they should at least be as hard as will safely bear forming in terminal curves without breaking. In the absence of a Bottom's or other gauge for selecting or assorting hairsprings, an old small-size, composition hunting-case watch may be converted into a serviceable gauge by removing the acting parts and fitting an arbor in the centre holes, with reduced bearings to lesson friction, then to this arbor, between the plates, attach, as usual, by a collet, one of the strongest American hairsprings, somewhat shortened to further strengthen it, and having its outer fixed to a stud in the plate. Immediately above the dial, on the large pivot of the arbor, is fixed a hand or index pointing to zero on the dial; and still above the hand, on the arbor pivot, is placed a device, by screw, slot, or otherwise, for holding the spring to be gauged by its outer end; the outer being held in an adjustable stud or clamp, contrived to be given a complete turn—sliding in the glass bezel—around the arbor as its centre; it will be seen that a full turn of this spring may thus be opposed to the first spring which, being, of course, the stronger, its excess of power is shown by the degree on the dial now indicated by the hand; and so the comparative strength of springs can be easily determined; the sixty minute marks of the dial serving as degree marks. The above gauge is suggested as being, perhaps, the most inexpensive and simple possible; unless the outer end of the spring to be gauged to be merely held in tweezers, instead of a stud, as above, while the gauge is rotated, and exact turn, and the degree noted as before.—*Western Jeweler.*

TRUE ENOUGH.—Angry customer—"You told me you would have those trousers of mine to-day." Tailor—"Quite right, sir, I have them."—*Clothier and Furnisher.*

EGG POULTICE.—The skin of a boiled egg is the best remedy for a boil. Carefully peel it, wet, and apply to the boil; it draws out the matter and relieves soreness.

TO CLEAN STEEL.—For a good solution for removing the blue from steel, so as to leave as clean as before coloring, try acetic acid, or solution of chloride of tin (stannous chloride).

LOBSTER LORE.—In buying cooked lobsters remember that a lobster that was alive when thrown into the boiler will have the tail curled up to the body, while one that was dead has the tail extended.

INK BLOTTER.—A blotter can be made that will remove ink spots from paper. Take a thick blotting paper and steep it several times in a solution of oxalic acid or oxalate of potassium. While the ink spot is still moist apply the prepared blotter, and the ink will be entirely removed.

GERMAN BREAD.—A cable despatch from Berlin, October 18, says: Experiments for the production of cheap bread, made necessary by the prevailing high prices, are increasing. Corn, barley, oats, buckwheat, peas, beans and potatoes have been tried, discarded and retried several times. Acorns were last tested, and it was thought for a time that they might answer the purpose, but they have been discarded. The only hope at the present moment seems to lie in corn.

BRIGHT STORIES.

A VERY PECULIAR CASE.

At the time it happened—thirty years ago—I was a bachelor, living in a drawing-room communicating by folding doors with the bedroom behind it, not a hundred miles from the Regent Circus. None of the furniture was my own save one or two easy chairs, a writing-table, and a rather shabby, dilapidated old bureau or escritoire—a relic of my grandfather's, I believe, and preserved by me as representing pretty nearly all the property I ever inherited. It stood in the darkest corner of the sitting-room, though near one of the two long French windows. I seldom went to it, using its numerous drawers, pigeon-holes, etc., only as receptacles for old receipts, bills, papers, and a few odd accumulations of no value, which, for some reasons I did not wish to destroy. The key to its circular top I had, with reprehensible carelessness in such matters, mislaid for weeks. This gave me no concern. I could look for it when I wanted it—that was enough. Other lodgers were in the house, which was kept by a retired butler and his wife, who, with three servants, attended on the inmates.

A young man's life in London, without his being the least unsteady, frequently involves him in late hours when he has a large circle of acquaintances. It was so with me, especially during one particular season. Operas, theatres, suppers, and dances crowded so thick and fast upon each other that, for nights together, I never had more than three or four hours in bed—always having to be up early. Then, by degrees, when I could turn in in reasonable time, I could not sleep, and on this account even the thought of a long night in bed gradually became a terror to me. The fact is, my nervous system was becoming thoroughly unstrung, though at that time I did not know what that meant. Certainly I never thought of it as an illness, and equally certain, would have scouted any idea of seeking advice about it.

In addition, another thing was worrying me greatly. For the past month or more I felt convinced I was being robbed. I did not possess much jewelry, but I was constantly missing certain little trinkets and small articles; among others a silver match box, a large crocodile leather gold mounted cigar case, a pair of gold sleeve links, a small locket, containing some of my mother's and father's hair, a set of studs, a pearl breast-pin, and the like; also a pocket letter or card case, which I well knew contained two £1 Scotch bank notes—unusual money, not easily forgotten. I felt sure that with every allowance for careless habits these and many another similar object had vanished in the most unaccountable way. Search high and low as I would, they were not to be found anywhere in my rooms.

I had lived there nearly two years when this vexation began, and I knew not whom to suspect. It was horribly awkward and most unpleasant. The landlord and his wife bore unimpeachable characters, and I could never have looked either of them in the face again had I breathed the faintest suspicion of their honesty. Three other men, two of whom I knew slightly, were lodging in the house, as I have said, but as to suspecting them of this petty larceny, the idea was out of the question. No, it must be one of the servants—but which? One of the three was a lad of sixteen. He was a newcomer, truly. The two women were in the house when I took up my quarters there—respectable "elderly parties."

I did not know what to do for the best. To lock up the rooms was impossible, and even to do the same with all my drawers, writing-table, wardrobe, etc., now, after never having previously turned a key on anything, would be at once to cast a slur on the establishment. Besides, I never could tell exactly when I missed this or that article, because, as I repeat, my careless ways had often led me to imagine that I had lost a thing when I merely mislaid it.

Presently the idea occurred to me that I would set a trap. I left a small sovereign purse in a corner drawer of the dressing-table, whence I could declare many trinkets and valuables had been purloined; but there it remained. I shifted it, partially covered it with other things, as if by accident, or as if it had been forgotten; yet it was always forthcoming whenever I looked. I put a solitary sovereign on a corner of the mantlepiece; the housemaid twice drew my attention to the fact that the coin was still lying there. No, nothing that I ever placed as a bait disappeared. The depredations were confined to such objects as I hadn't been thinking about until I wanted them.

The month was August, the nights hot and sultry, and less than ever conducive to sleep. I had nothing to do that evening, and, although I turned in early, it was with the usual result. The clock had just struck one, and I had been in bed since eleven o'clock without closing my eyes. It was the old story; I was accustomed to it. Suddenly, amid the host of perplexing and even awe-inspiring thoughts whirling through one's brain under these conditions, I remembered that pocket letter containing the two £1 Scotch bank notes. Where was it? I had not seen it for weeks. After restlessly striving to drive away the desire to get up and get it, it mastered me, and out of bed I sprang. For fully an hour I carried on the quest, but all in vain. Every conceivable corner, drawer and pocket was ransacked. The key of the escritore had been mislaid, so I could not examine that; but I knew it contained little or no papers.

At length, entirely exhausted, irritated and fevered, and with the chamber candle expiring with a splutter, I flung myself on a couch in the drawing-room. Dawn had not yet broken, but in a few minutes, as I lay there coiled up in my dressing gown, I unexpectedly fell asleep—a restless, dreaming sleep, full of fantastic, weird-like indescribable shapes.

When I awoke it was daylight, though the room was still shadowy and obscure, save in one spot close to the long window, where the Venetian blind was partly raised—the window nearest that dark corner occupied by the old escritoire. The head of the couch was toward the mantel-piece, but almost facing the door from the landing on the further side of the wall.

At the moment I opened my eyes with a feeling of relief at having just escaped some visionary peril, to my amazement I saw that door slowly open and the figure of a man stealthily entering it. It did not make the faintest noise on its hinges, nor did he with his footsteps—not so much as the creaking of a plank. The light in that part of the room was far too dim to allow of my seeing what he was like. His face was slightly averted also, and, except that the general looks of the man seemed to be not altogether unfamiliar, I could not in the least tell who he was. The first impulse, of course, was to sit up and call out, but for some inexplicable reason I restrained it—perhaps because the thought instantly crossed my mind that here was the thief, and upon that I suppose I rapidly concluded to watch him, and pretended to be still sleeping.

However this may be, I did not move as I observed him creep noiselessly across the room to the end of the mantel-piece farthest from that where I was lying. He appeared not to notice me, and, after feeling for a moment between the edge of the looking glass and the wall by the mantel-shelf, he took something away, and instantly crossed back to the window by the escritoire. He passed the little gap of light so quickly into the dark corner that I still failed to recognize him. Then I could dimly make out that he was apparently unlocking the lumbering piece of old furniture, though still without making the slightest sound.

"Ho! ho?" thought I, "my fine fellow, now I've caught you, have I? You have found the key, and are going to exercise your calling in that direction, eh? Well, there's not much that's worth your attention there; you won't find that a profitable hunting ground!"

I was not long, you may depend, in coming to a determination. While he was still fumbling at the escritoire I rose, and, stealing softly up behind him, suddenly seized him by the back of his collar. He endeavored to writhe out of my grasp, but I turned him around so quickly that we both staggered and fell on the floor in a huddled heap together—he undermost. In the fall I struck my forehead severely against something, probably a projecting chair. For the moment the blow seemed to blind me; but as we had rolled over into the gap of light from the window I caught sight of his face, turned up as it was toward mine, and I saw—whose face, think you? Why, no other than my own—yes, my very own, as I well knew it in the looking-glass.

That one instant of amazement and consternation in which, as by a flash, I made this recognition, was followed by a total oblivion of all surroundings. The face and figure seemed to fade away beneath me and to vanish with my consciousness.

How long I lay prostrate, face downward on the floor, I know not; but in that position I found myself when my bewildered senses slowly returned. For awhile, of course, I could remember nothing—how I came there or what had brought me to such a pass. Only very slowly did the circumstances recall themselves. What on earth did they mean? My forehead was unmistakably cut and still bleeding; indeed, there was a patch of congealed blood on the carpet plainly visible in the broad flood of early sunlight now streaming in beneath the half-raised blind. Had I been dreaming? More likely I had had a fit; anyhow, I was so utterly bewildered that it was some time before my thoughts became coherent. Then alarmed and fully conscious for the first time in my life that I must be seriously ill or laboring under some mysterious mental aberration, I rose from the floor and sat down in an adjacent chair.

As my eyes wandered vacantly around they fell upon the circular top of the old escritoire. It was practically open. Some one had been at it, then; that was clear. That was no dream, no fancy—scarcely due to a fit, one would think—at least, not of the sort I had tremblingly thought of. Yes, and there was the missing key in the lock. When these facts had been fully broken in upon my cob-webbed brain, they led to but one idea. Acting upon it, I pushed the lid full open, and with the rapidity of thought pulled out one drawer after another, and there, in most of them, were deposited a lot of the articles and objects I had so long missed—there, in this neglected, useless piece of old furniture? I turned them all out in a confusion worse confounded than my thoughts. But there they were—almost every one; cigar case, silver match box, trinkets, locket and pocketbook containing the Scotch bank notes.

Then, how on earth had they come to be in this place? A thief would hardly have stolen them to conceal them thus in my own apartments, unless—unless—and then, very reluctantly, slowly, and at first but vaguely, did I arrive at the conclusion—unless the thief was myself!

Verily, this was an alarming supposition, and confirmed my worst dread. I must be suffering under some frightful, inexplicable brain disease, for that I had done this thing I was wholly and totally unconscious.

For days and days, however I took no action. I hesitated to breathe a word of the extraordinary affair to a soul. Who would believe it? Everybody would say I had gone out of my mind—I thought so myself. I doubted if any doctor would accept as veracious this wild account of my dread awakening to the truth. Yet, as I knew it to be truth, I set this record of it down while it was all fresh in my memory, and eventually, being unable any longer to bear the horrible suspense

and perplexity in which the strange experience had left me, I put it before a medical friend.

To my unspeakable astonishment, he believed every word of it. Then, after answering his endless, searching questions, and when he had listened to such verbal additions to the narrative as I could give him, he did not doubt one single point.

"Yes," he said, "among other complications, you probably have been walking in your sleep and yourself secreting the various articles from time to time. The key, to wit, of the escritoire, which you imagine to have been the object taken from behind the looking-glass, by the figure you fancy you saw, had been placed there by your own hand. Your brain retained some dim perception of your having done so, and the disordered condition of your nervous system accounts for that perception assuming the shape of a figure resembling yourself, and in a state of partial unconsciousness you dashed upon your imaginary burglar—your own ghost, in fact—fell and fully restored your senses to their equilibrium by that rap on your head. However, it is enough for you if I tell you that your nervous system is wholly broken down, and that if you don't take a long holiday, go into the country, and for the next three or four months lead a perfectly regular, quiet life, I won't answer for the consequences. No, I shall give you very little medicine. Fresh air, quiet, and regularity are the only drugs you stand in need of."

His advice was followed to the letter, for I was thoroughly frightened. Thirty years have passed; I have long been married, and I have never missed a single piece of property, large or small, since that extraordinary August night.—*All-the-Year-Round.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

October.

MEATS.—Beef, mutton, ham, kidneys, liver, venison, sausage.

GAME AND POULTRY.—Pigeon, chicken, duck, woodcock, brant, grouse, partridge, rabbit, snipe, goose.

FISH.—Bass, blackfish, bluefish, clams, cod, crabs, eels, carp, catfish, flounder, halibut, herrings, lobster, mackerel, mussels, oysters, pike, porgie, prawn, rockfish, salmon, sea bass, sturgeon, smelt, turtle, white fish, whiting.

VEGETABLES.—Artichokes, beets, beans, broccoli Brussels sprouts, cabbage, carrots, cauliflower, corn, cucumbers, egg-plant, garlic, lettuce, onions, parsley, parsnips, potatoes, radishes, rhubarb, savoy, shallots, spinach, squash, tomatoes, turnips, watercress.

FRUITS.—Apples, bananas, blackberries, grapes, melons, oranges, peaches, pears, pineapples.

PRACTICAL RECIPES.

SPANISH STEW.—This is an excellent way to use up tough cold beef. Take two or three pounds of cold meat and cut it into small pieces, put it in a stew pan with a can of tomatoes, two good-sized onions cut in quarters and five or six sticks of maccaroni broken into small pieces. Cover the stewpan and cook until the meat is reduced to shreds, which will be for three or four hours. If the gravy boils away add boiling water enough to make it the required thickness; season highly before serving.

BOILED HALIBUT.—Take a piece of halibut weighing four pounds. Put it into the fish-kettle with the back of the fish undermost, cover it with cold water, in which a handful of salt has been dissolved. When it begins to boil, skim it carefully, and then let it just simmer till it is done. It will require nearly thirty minutes, to boil it. Drain it, garnish with horse-radish; egg sauce or plain melted butter, are served with it.

LARDED SCALLOPS.—Cut some fatty bacon into thin strips and draw a piece crosswise through each scallop, dip them then in egg and cracker dust and fry brown in very hot lard.

BACON TOAST.—Cut some thin slices of bread, about two or three inches long, and some streaked bacon in small pieces, dip them into a raw egg beaten up with shred parsley, green onions, shallots, and pepper; fry over a slow fire, and serve with clear sauce and a little vinegar in it.

GELATINE BLANC MANGE.—Put one-quarter box of gelatine to soak in a little milk for an hour, then add one-half cup of boiling milk and stir until thoroughly dissolved; add enough of sugar to make it very sweet, and flavor with vanilla. Whip stiff two teacupfuls of sweet cream. Whip the hot gelatine until it is cold and begins to thicken, then beat in the whipped cream, pour into a mold and set away to stiffen. Serve with cream.

STUFFED POTATOES.—Select large fine potatoes and bake them thoroughly. Cut them in halves, lengthwise and scoop out the insides. Season the potato with pepper and salt, and mix with it some cold cooked sausage chopped fine. Fill up the cases, brush with beaten egg and brown in the oven. Serve on a napkin.

PICKLED CABBAGE.—Take two nice white cabbages and cut them in quarters; put them in salted water for twenty-four hours, then boil them tender in weak vinegar with a little tumeric in it, put them in jars, pour cold vinegar over them, tie up and set away.

PHANTOM PARTIES.

REVIVAL OF AN OLD-FASHIONED SOCIAL AMUSEMENT.

The old "phantom party" idea, renovated by the witchery of a "web of fate," is with us again. The phantom costume consists, as every one knows, of a large enveloping sheet, a pillow case with apertures for the eyes, or a mask shrouded with a pillow case, about the head. Costumed in this ghostly attire the hostess receives her guests in silence. She greets them without words and motions them to the toilet rooms, from which they emerge clad in the white disguise. Each phantom guest receives on entering the parlor a single bright thread of the "web of fate." This thread is of the bright-colored twine now to be purchased in the shops, and is about twenty yards in length. It is suspended from some conspicuous place over the chandelier, the doorway, or a picture, and thence pursues its intricate and winding way over doorways, behind bookcases, up stairways and down again, even out-of-doors and into kitchens, until finally, in some secret place, it is tied about the hidden "fate."

These "fates" are written upon rolls of paper, and set forth the destiny of the person for whom each is prepared. On the cleverness of the hostess in writing prophecies in accordance with the whims and hobbies of each guest, as well as the humor and wit desirable in the composition, depends the success of the entertainment. Quotations are also made to do duty in this capacity when originality and ingenuity are lacking. Each of the strings in the net must be of a decided tint contrasting with all the others as they cross and recross many times in the disentangling. They must also be of the same length, as a prize is given to the phantom who first discovers the roll of fate. The quest is pursued in silence, which is broken only when the fates are all found and read aloud to the assembly. Then there are unmasking and hilarity galore.—*Sun.*

LENSES.

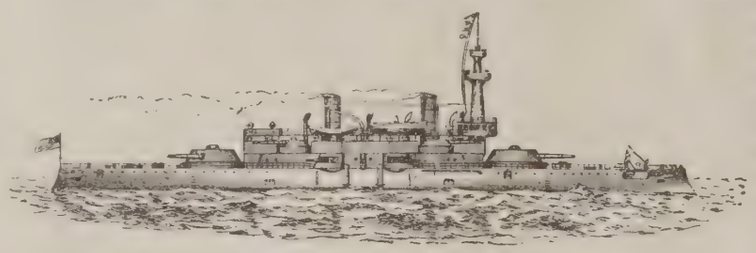
HOW SPECTACLE GLASSES ARE GROUND.

The art of making spectacles, says the *Popular Science Monthly*, has been reduced to a science. The bit of glass to be formed into a lens is fastened by means of pitch to a small block of hard rubber so that it may be more readily handled. It is ground by being pressed against a rapidly revolving metal tool, whose curvature is equal and opposite to that desired in the lens. This is known as the "rough tool" and is made of cast iron. It is mounted on a verticle spindle, and is kept moistened with emery and water. Several grades of emery are used in succession, changing from coarse to fine as the grinding proceeds. As a result of this process the glass has a rough surface and is no longer transparent. It is now transferred to the "fine tool." This is made of brass and has its surface as true as possible. It is compared from time to time with a standard curve in order to insure accuracy. In this second grinding the abrading materials is rouge (carefully calcined sulphate of iron). Finally the lens is polished by being pressed against a piece of cloth powdered with rouge and fastened with the rotating tool. The glass is now loosened from its block, turned over, and the reverse side of the lens is ground. When this has been accomplished the lens must be cut down to the proper shape for mounting in the spectacle frame. It is placed on a leather cushion and held firmly in position by a rubber-tipped arm while a diamond glass-cutter passing around an oval guide traces a similar oval on the glass below. The superfluous glass outside the oval is removed by steel pincers, the rough edges are ground smooth on Scotch wheels and the lens is ready for mounting. The glasses for small telescopes, microscopes, burning glasses and the like are ground in the same fashion.

SPONGES.

VARIED FORMS FOUND IN THE DEPTHS OF THE OCEAN.

Some of the most beautiful things that live in the ocean are the sponges of the great depth, which have often very curious and interesting forms. Not least remarkable are the so-called "sea nests," which are in the form of spheres or sometimes egg-shaped. The outer coat of one of these specimens is a complicated net work, over which a delicate membrane is spread. An ornamental frill adorns the upper part, while the lower portion throws out a maze of glossy filaments like fine white hairs. These hairs penetrate the semi-fluid mud in every direction, thus holding the sponge in its place, while a continuous current of water is drawn by waving "cilia" through all parts of the mass, passing out by a hole at the top. In this manner the animal absorbs whatever food may be afloat. Another singular sponge is the "glass rope," which sends down into the mud a coiled wisp of filaments as thick as a knitting needle. The latter opens out into a brush fixing the creature in place after the manner of a screw pile. Still another remarkable sponge is found in the deep water off the Loffoden Islands. It spreads out into a thin circular cake, surrounded by what looks like a fringe of white floss silk. Yet another curiosity is the "eupectella" sponge of the Philippines, which lives embedded to its lid in the mud and supported by a lovely frill.



PRIMITIVE COMFORTS.—In the year 1200, chimneys were scarcely known in England. Only one was allowed in a religious house, one in a manor house, and one in the great hall of a castle or lord's house; but in other houses the smoke found its way out as it could.

Subscription $1.00 per year. Now is the time to subscribe.

THE COLUMBIAN EXPOSITION.

THE PROPOSED MACHINERY HALL AT THE CHICAGO EXPOSITION.

We continue our description of the preparations progressing in Chicago for the grand International Exposition of 1893. One of its conspicuous features will be the Machinery Hall, upon which work has recently been begun. On the lower part of this page will be found an illustration of the splended structure The main machinery building measures 850 by 500 feet. It is spanned by three arched trusses, and the interior will present the appearance of three railroad train houses, side by side, surrounded on all the four sides by a 50-foot gallery. The trusses are to be built separately, and so that they can be taken down and sold for use as railroad train houses, and it is hoped to have iron trusses instead of cheaper ones which may, however, be necessary. In each of these three long naves there is to be an elevated traveling crane, running from end to end of the building. These will be useful in moving machinery, and when the Exposition opens, platforms will be placed on them, and visitors will view from these the entire exhibition at a great saving of tramping. Shafting for power will be carried on the same posts which support these traveling bridges. Steam power will be used throughout this main building, and this steam will be supplied from a main power house adjoining the south side of the building. The exterior towards the stock exhibit and the railroad is to be of the plainest description. On the two sides adjoining the grand court, the exterior will, however, be rich and palatial. All the buildings on this grand plazza are designed with a view to making an effective background for displays of every kind, and in order to conform to the general richness of the court, are enriched with colonnades and other architectural features. The design follows classical models throughout, the detail being borrowed from the Rennaisance of Seville and other Spanish towns as being appropriate to a Columbian celebration. As in all the other buildings on the court, an arcade on the first story permits passage around the building under cover; and as in all the other buildings the fronts will be formed of "staff," colored to an ivory tone. The ceilings of the porticoes will be emphasized with strong color. A colonnade with a café at either end forms the connecting link between Machinery and Agricultural halls and in the center of this colonnade is an archway leading to the exhibits. From this portico there will be a view nearly a mile in length down the lagoon, and an obelisk and fountain placed in the lagoon between the two buildings, Agriculture and Machinery, will form a fitting point to this vista. The machinery annex will be placed in the rear of the Administration building. It will be entered by tunnels or subways, as well as by bridges, from Machinery Hall, and the buildings for Administration, Mines and Transportation. It is to be very large but very simple building. While in the main Machinery building a railroad train house is the type, in the annex a mill or foundry will be considered the model for construction. It is all to be built of wood and in the most economical manner. The building will have a nave 100 feet wide, with a 50-foot wide leanto in one story on the inside, and a 50-foot wide leanto on the outside. Within the inner circle will be a park in which visitors fatigued by the hum of machinery may rest. The power will be transmitted by shafting crossing the building at each bay, with a moter at each shaft. The electrical power will be used in the annex, and the steam power in the main Machinery building. Attached to this great annex will be the power house, convenient to the tracks for coal supply, etc., containing an immense display of boilers, while in the adjoining portion of the annex building will be established the enormous plant of engines and dynamos. This will probably be the largest and most interesting display of electric power ever made, and will be one of the principle features of the Exposition. It is possible that gas will be used instead of coal for fuel beneath the boilers, and in that case a building will be prepared for making this gas.

UNITED STATES COAST LINE BATTLE SHIP.

MACHINERY HALL, NOW BEING ERECTED FOR THE COLUMBIAN EXPOSITION.

WORLD'S FAIR NOTES.

More than 15,000,000 feet of lumber will be used in the construction of the huge building for Manufacturers and Liberal Arts.

The foreign commissioners—Sir Henry Wood and James Dredge of England, Herr Wermuth of Germany and Dr. Emil Meyer of Denmark,—are greatly impressed and pleased at the building plans and extensive preparations for the Exposition. Said Mr. Dredge: "I have examined the plans very carefully. They contemplate the erection of magnificent buildings. They are bold, striking and, I may say, far in advance of our anticipations. From an architectural point of view I do not believe they could be improved. And I am assured that the landscape effects will be in harmony with the architectural features. Mr. Olmstead is the greatest landscape engineer in the world. The work he has done for the World's Fair shows that."

A reproduction of Independence Hall is now proposed as Pennsylvania's building at the Exposition. Prizes of $1,000, $500 and $300 have been offered for the best plans for a State building but it is thought the State commission will seriously consider rejecting them all and reproducing Independence Hall instead.

The Association of Civil Engineers of the City of Mexico has voted unanimously to attend the Exposition in a body.

American jewelers are contemplating the project of massing their exhibits at the Exposition, believing that a more effective showing can be made in that manner. The matter is not yet decided. Foreign jewelers are preparing to make an exhibit of unprecedented extent and value.

A Turkish flag was hoisted at the World's Fair ground on Sept. 20th with appropriate ceremonies. It was raised on the site which Robert Levy, of Constantinople, has secured for his Turkish specialties. He will reproduce a Constantinople street, show most of the striking features of Turkish life and have a novel and interesting collection of Turkish goods and curios. The flag was raised in conjunction with the stars and stripes and is the first one of the scores of foreign flags eventually to enliven Exposition scenes.

AN ARIZONA LIZARD.

A GILA MONSTER IN WASHINGTON.

Writing from Washington City the brilliant correspondent, René Bache, says: A Gila monster has been placed on exhibition within the last few days at the National Zoological Park. "*Heloderma Suspectum*" the label reads on the glass-covered box in which it is confined. Its last name will suggest to visitors the impudence of toying with the animal. Its breath, deemed so fatally poisonous, has not thus far done damage to any of a score of persons who have accepted invitations to take a whiff off it. A foot and a half in length it measures, and it looks exactly as if it were made of light salmon-colored beads with a pattern in black beads worked in When eating, it sticks out its big black forked tongue and licks each morsel well before taking it into its mouth and swallowing it. The scientific men here in Washington entertain widely differing opinions as to the poisonous character of this celebrated reptile's bite. Dr. R. W. Shufeldt believes that it is venomous. He speaks from experience with a Gila monster that was sent to the Smithsonian Institution from Arizona a while ago. "I had taken the animal out of the box for the purpose of examining it," he says, "and was in the act of putting it back when my grasp slipped. It made a dart at me, and, seizing my right thumb in its mouth, sank its teeth to the bone, inflicting a severe lacerated wound. It loosed its hold at once. The bleeding soon ceased, but it was followed by shooting pains up the arm and down the same side. So severe were the pains, taken together with the nervous shock, that I fell in a faint. I perspired profusely. My hand swelled very much, but the next morning the swelling was lessened, and the wound soon healed, leaving no scar. After inflicting the bite, the heloderma appeared dull and sluggish, just as a venomous serpent is torpid somewhat after having given a deadly nip. My impression is that the bite of this creature might be fatal under some circumstances." This accords with the theory entertained by Professor B. D. Cope, the greatest living authority on reptiles. Said he: "The *Heloderma suspectum*, to which I gave that name for reasons which seemed to me justified, has four glands containing a salivary secretion, concerning the poisonous nature of which there is dispute. Its teeth are grooved, apparently for the purpose of conveying the secretion made by these glands into the bitten wound. This venomous apparatus, supposing to be properly so designated, was presumably developed in the same manner and through the same causes as produced the poisoning equipment of snakes. In my opinion, the poison glands of serpents are simply modified saliva glands. To those animals, being stepped upon has always been a cause of irritation and misery. On this account, in the course of long ages, their saliva has gradually become poisonous, so as to serve for the purpose of defence, and at length special glands and apparatus rendering their bite harmful have been developed. The same argument may apply to the sluggish and otherwise defenceless Gila monster." Dr. Weir Mitchell, of Philadelphia, has been in Washington during the past few days. He is a believer in the venomous character of the Gila monster, and his opinion is worth something, not only because he is recognized as the greatest authority in this country on snake poisons, but for the reason that he made a series of experiments some time ago for ascertaining the effects produced by the fluid from the heloderma's glands upon rabbits and guinea pigs inoculated with it. A supply of the alleged poison was got by causing the lizard to chew the edge of a saucer. An hypodermic syringe was used to inject it beneath the skin of each of the animals treated, and they all died. It was found that the venom killed by paralyzing the heart, and this was deemed rather curious inasmuch as snakes' poison produces death by paralyzing the breathing organs. The heart of each guinea pig and rabbid ceased to beat soon after the inoculation, and the spinal cord was paralyzed also This method of administering the venom was employed because the deaths might otherwise have been considered to be more or less attributable to the shock and laceration of the bite. Snake poison, dried, will preserve its properties for an indefinite length of time; it would be interesting to know whether or not the venom of the heloderma has the same property. However, Dr. Yarrow, of Washington, has tried experiments with rabbits and guinea pigs by inoculating them with the poison of the Gila monster, without producing any results whatever, and he therefore believes that it is not a venom at all or calculated to be in any way more injurious than ordinary saliva. It is believed the Gila monster lays eggs, but no body knows with certainty. Captain Bendire is sure of it. He has charge of all the eggs at the Smithsonian Institution. A while ago he dissected a heloderma and found eight eggs inside of it. Each of them was three-quarters of an inch long by one-third of an inch in width, bluntly pointed at each end and in shape like the egg of an alligator. They were covered with a smooth, soft white skin, however, instead of with a hard glossy shell, like those of the saurian referred to. It may be that they would have hatched before birth, the young coming into the world alive, as happens with many reptiles; but this did not seem likely.

HOW CUTTING. — "Hullo, Gerty! You've got Fred's hat on and his overcoat." "Yes. Don't you like it?" "Well—It makes you look like a young man, you know, and that's so effeminate!"—*Punch*.

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

GUNS ON A NEW PLAN.—Dr. Gatling, the inventor, has added to his numerous devices an invention by which he expects to revolutionize the manufacture of heavy ordnance, and he has decided to locate in Marion, Ind., a plant for that purpose. The new process includes a composition and a mechanical device. The former he declares to be much greater in tensile strength than any now in use, and to this he proposes to add by a device for coiling the metal about the case and by cooling the gun from the inside. The composition has been tested to the satisfaction of the inventor, and, the process being infinitely more rapid than any now applied, he expects to have the first gun ready for a test in three months.

ORIGINAL. No. 27.

Pompton Puffs.

BY MARION HARLAND.

3 cups of flour, 1 tablespoonful of butter, ½ teaspoonful of salt, 2 cups of milk, 4 eggs whites and yolks beaten separately, 1 heaping teaspoonful of Cleveland's baking powder.

Sift flour, baking powder and salt together twice, chop in the butter. Stir the beaten yolks into the milk and add the flour, then the frothed whites. Whip high and light and bake in cups in a quick oven.

Use only Cleveland's baking powder, the proportions are made for that.

Hot biscuit made with Cleveland's baking powder may be enjoyed even by those of weak digestion. Cleveland's is the anti-dyspeptic leavening agent. The leaven comes from cream of tartar and soda, nothing else; no ammonia or alum.

A Tonic

Horsford's Acid Phospha'e.

A most excellant and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy :

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

The Key to Success

in washing and cleaning is *Pearline*. By doing away with the rubbing, it opens the way to easy work; with *Pearline*, a weekly wash can be done by a weakly woman. It shuts out possible harm and danger; all things washed with *Pearline* last longer than if washed with soap. Everything is done better with it. These form but a small part of the—Why women use millions upon millions of packages of *Pearline* every year. Let *Pearline* do its best and there is no fear of "dirt doing its worst."

Turn the Key

On the peddlers and grocers who tell you "this is as good as," or "the same as" Pearline. IT'S FALSE; besides, Pearline is never peddled.

236 JAMES PYLE, New York.

BUSINESS NOTES.

SURA CURA.

Malaria, in some form or other, is charged with being the cause of most of the ills borne by afflicted humanity, and it is for the cure of malaria, and the diseases arising therefrom, that a leading New York firm, R. W. Robinson & Son, 184 Greenwhich Street, has put upon the market an efficacious and therefore swift-selling preparation. The name of this great antitode for malaria—Sura Cura—most admirably describes its wonderful effects. It is a sure cure for rheumatism and neuralgia, diseases than which there are none more prevalent or painful Sura Cura is sold throughout the entire country for 50 cents and $1, which is half the cost of a single physician's call. But it would be cheap if it cost any multiple of times what a doctor charges for his visits, for there is no price too great to pay for health and few diseases are more difficult to cure than those for which Sura Cura is so admirable a remedy. In common parlance, Mr. Robinson's remedy "gets there every time," as many cured cases of rheumatic and neuralgic troubles will joyfully testify.—*Exchange.*

SAFE TRAVEL.—The Chairman of the National Board of Steam Navigation declared recently that travel on water in a steam craft was the safest in the world, inasmuch as only sixty-five persons were killed last year out of over 500 000,000 who traveled in 3,947 steam vessels.

GAS AND LEATHER.—Mr. Wiesner has published a communication tending to show that the products of combustion of gas have no action on paper and that gas can be used with perfect safety for the illumination of libraries. The chief difficulty, however, does not lie with paper, but with leather—it is the bindings that suffer. Exhaustive experiments upon leathers of various grades would be most valuable to librarians.—*Invention*, London.

COSTLY BENEFITS.—A single page in one issue of the *Century*, taken for advertising purposes, costs $500; in *Harper's*, $400 down to $100. A yearly advertisement in one column of the New York *Herald* costs $30,300 for the lowest, and $310,000 for the highest price column. These figures will doubtless be of interest to men who invest two or three dollars per month, and flatter themselves with the idea that they are extensive and liberal advertisers.

A TALL SCHEME.—M. Eiffel is stated to be supporting a project for the erection of an observatory on the summit of Mont Blanc.

WISE PRECAUTION.—Paris requires every vehicle traversing its streets at night, if only a wheelbarrow, to carry a lighted lamp.

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs, 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

THE QUEEN'S PRIZE SCHOOL OF HISTORY.

About two years ago the publishers of THE CANADIAN QUEEN added what has proven to be a very popular and successful feature to their publication in establishing their Prize History School. It has offered competitive examinations in English, Canadian and American History, giving valuable rewards to those making the most correct answers. During this time there have been added the names of over forty thousand new subscribers to their books. Rewards have been made by THE QUEEN which have cost them in cash over ten thousand dollars. THE QUEEN'S Prize School of History has received the sanction and support of the clergy, press, and, in fact, of the best people of the Dominion of Canada. The following, taken from a leading daily newspaper, expresses an opinion which is universal:

A HANDSOME PRIZE.

AN EVIDENCE OF WHAT A GENUINE MAGAZINE COMPETITION OFFERS.

"On Friday there arrived from Toronto, for Miss M. Hora, a handsome Shetland pony, harness and cart, being the first award in the Royal Quilt Competition of THE CANADIAN QUEEN magazine. It attests the genuine nature of the magazine's contests by its excellent condition and value. THE QUEEN has frequent competitions and has made innumerable awards, displaying a generosity quite surprising to those who have had experience of the limited field for Canadian journalistic enterprise. But THE QUEEN has been a success as a business venture from the start, and is growing in literary excellence steadily. It covers the field of fashion, as well as light reading; talks to the household, the young, and, indeed, all home classes. The competitions have been used to assist the introduction of the magazine, for where it is introduced it is quite certain to remain a monthly guest. The leading prizes have been made, as instance this latest to Kingston, while many smaller prizes have rewarded the moderately successful among competitors. THE CANADIAN QUEEN is truly royal in its ways."—*The (Kingston, Ont.) Daily British Whig*, June 27th, 1891.

QUESTIONS IN AMERICAN HISTORY.

1.—Give the names of the early navigators who it is claimed by historians first discovered America.

2.—From whom has America taken its name?

3.—What class and nationality first settled Virginia? New York? Massachusetts? Pennsylvania? Maryland?

4.—What action did the Continental Congress of 1774 take and what was the result of that action?

5.—What was the first battle fought in the War of the Revolution?

6.—What nation rendered the Americans great assistance in the War of the Revolution?

7.—Give the names of the committee appointed to draft the famous Declaration of Independence.

8.—What was the date of the signing of the United States Constitution?

9.—After becoming a nation and before the great Civil War, what were the principal conflicts which engaged the Americans?

10.—What was the direct cause of the Civil War? What Generals of the Northern Army have occupied executive positions under the Federal Government since the closing of the War? Who was Commander-in-Chief and who were the principal Generals of the Confederate Army during the struggle?

11.—How long did this War last and what is the computed loss of life?

12.—What can be said to day of the United States as a nation?

To the *First* gentleman sending the correct answers to the above questions in American History the publishers of THE QUEEN will present "**Majestic**" acknowledged the **Handsomest and Finest Riding Horse in Ontario.** ("Majestic" is sixteen hands high, thoroughbred, seven years old, and valued at $350.00.) To the *First* lady the publishers of THE QUEEN will present an elegant **Jacket of Genuine Alaska Seal** to be made according to the measurement supplied by the winner. To the *First* boy under sixteen years of age the publishers of THE QUEEN will present a **Little Giant Safety Bicycle** valued at $75.00. To the *First* girl under sixteen years of age the publishers of THE QUEEN will present an elegant **Music Box,** playing twenty tunes, finely finished and valued at $55.00.

To the gentleman from whom the *Last* correct answers are received before the close of this Competition, the publishers of THE QUEEN will present a **First Cabin Passage to Europe and Return** and **$200 in Gold** for expenses. This trip can be taken by the winner any time before October 1st, 1892. To the lady from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Pony, Cart and Harness.** To the boy under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present a **Solid Gold Watch** containing one of the best American movements, and valued at $75.00. To the girl under sixteen years of age from whom the *Last* correct answers are received before the close of this Competition the publishers of THE QUEEN will present an elegant **Solid Gold Watch,** containing one of the best American movements, and valued at $65.00.

ADDITIONAL PRIZES IN ORDER OF MERIT: Silver Tea Services, Ladies' Gold Watches, Silk Dress Patterns, French Mantel Clocks, Portiere Curtains, Toilet Cases, Manicure Sets, and many other useful and valuable articles.

The object of the publishers in offering these liberal prizes is to introduce THE QUEEN Magazine into **new** homes. Answers must be mailed *on or before* November 10th, 1891, and must be accompanied by $1.00 for one year's subscription to THE CANADIAN QUEEN. Prizes awarded to subscribers residing in the United States will be shipped to them **free of duty.** The distribution of awards is in the hands of disinterested persons, and decisions will be based on the correctness of answers. Use your own language in wording the answers. No corrections can be made after your answers are mailed. THE QUEEN is a large, forty-eight page family magazine, especially interesting to ladies and children, and visits regularly **over one hundred thousand of the best homes** in Canada and the United States. The awards in THE QUEEN'S Prize School of History are made strictly with regard to merit, without partiality to persons or locality. The decisions must be accepted as final. If you have never seen a copy of THE QUEEN send six U. S. two cent stamps and receive a late number, post paid, containing letters from those who have received rewards in previous contests.

Address THE CANADIAN QUEEN, PRIZE SCHOOL OF HISTORY, 58 BAY STREET, TORONTO, CANADA.

THE WEATHER BUREAU.

The new chief of the Weather Bureau, Mr. Harrington, on October 20th sent to the Agricultural Department a special report of the operations of the bureau since its transfer to that department on July 1st last. Mr. Harrington says the service has been reorganized, with a view of carrying out the expressed intention of Congress to especially develop and extend its work in the interest of agriculture. The daily cotton region reports, consisting of maximum and minimum temperatures and rainfall, met with great favor. At the urgent request of those interested in cotton, telegraph information of the first killing frost at every cotton region station will hereafter be included in these reports. A service similar to that now carried on for the benefit of the cotton interest has been requested for the sugar and rice interests of south Louisiana. It is designed to establish not exceeding ten stations of observation in the sugar region, from which reports of temperature, rainfall, and frost will be telegraphed to a designated centre daily, and this information will be given the press for publication and disseminated generally throughout the sugar belt in bulletin form, for the information of the planters and factories. Since the first of July new weather services have been organized in Arizona, California, Florida, New Mexico, North Dakota, Oklahoma, Utah, Virginia, Washington, West Virginia, and Wyoming. More than a hundred voluntary meteorological stations have been established and equipped with instruments at the expense of the bureau since July 1st, and nearly as many have been established by the bureau, but were furnished with instruments at private expense. On September 30th there were over 1,200 weather signal display stations in operation, an increase of about 100 per cent. in less than three months. There are now probably 2,000 voluntary observers in the United States reporting to the Weather Bureau, an increase of about 400 in the past three months, and steps are being taken to cover every section of each State and Territory in the United States with volunteer stations of observation, so as to leave no section without stations from twenty to thirty miles apart. A compilation of climatic data for southern European countries, including the Riviera, called for during July of the present year, has shown that portions of the United States possess climatic conditions surpassing in some respects those of the health resorts and sanataria toward which travel has been directed for a century.

PURE FOOD PROSPECTS.

While the manufacturers and dealers in food products are borrowing the mantle of professed "purity" to attract attention to exhibitions of their wares, a genuine movement in behalf of pure food is being diligently prosecuted by the authorities in Washington. At the coming session of Congress the subject of pure food legislation will probably be revived, and it is reasonable to hope that some tangible results will be reached. Senator Paddock, of Nebraska, spent a deal of time on his pure food bill in the last Congress, and it would probably have passed the Senate if there had been time to consider it. It was put on the Republican caucus programme during the closing days of the session, but other important measures prevented its being reached. The bill, as finally perfected, limited Federal control of food products to those which were the subject of commerce between the States or with foreign countries. This rule escaped the constitutional difficulty of interfering with commerce within the States, while making it pretty certain that the standard for inter-State commerce would soon become the standard for all traffic in food products. Most industries of any magnitude manufacture for consumption outside their States as well as within them, and domestic consumers would hardly be content to accept a different grade of goods from that required by the people of other States. But the agitation in behalf of pure food has extended beyond the limits of the United States and has grown into a subject of international discussion. In his forthcoming annual report Secretary Rusk will, we are informed, recommend the establishment of an International Commission to protect the people of the leading civilized counties from impure and adulterated foods. The plan originated at the recent Agricultural Congress at the Hague, and was recommended by vote of the Congress to all the governments represented there. Dr. D. E. Salmon, chief of the Bureau of Animal Industry, was representative of our Government at the Congress and is warmly in favor of the proposed commission. The commission, while international in its scope, would in practical operation be more like a body of national commissioners in each country, co-operating with each other by constant correspondence. The local commission in each country would be charged with watching the enforcement of the local laws, and would assist the commissioners in other countries by informing them promptly if impure food products were received from their countries. Meetings of delegates from each local commission would undoubtedly occur once or twice a year, and legislation would gradually be urged upon the different countries as nearly uniform and complete as local feeling would permit. The exact form in which the matter shall be presented to the various governments was not decided at the Congress, but it is probable that the offices will send a copy of their resolutions to the Foreign Office of each of the governments taking part, and their natural course will be to refer them to the Ministry of Agriculture or of Internal Affairs. This is what will be done in this country. The subject will probably be discussed in Cabinet meeting, and Secretary Rusk will be a warm champion of any measure for protecting the purity of the food supply. If proper legislation is adopted, without extending too much the army of office-holders or interfering too much with private enterprise, it will be of benefit in extending our foreign trade.

WOMEN WHO WANT TO VOTE.

The Workingwomen's Society, the central body representing the organized workingwomen of New York, has passed, unanimously, resolutions stating that disfranchisement is a burden too heavy for any class of people to bear; that hundreds of thousands of the poorest people in this State are most unjustly and unlawfully disfranchised, thus making their poverty far worse than it would otherwise be; that this poverty is such that in New York City alone over a hundred thousand working women are toiling on starvation pay, and that this dreadful poverty of workingmen's sisters widows and daughters is the main cause of the worst of public evils, and calling on the Legislature to relieve the working women of the State from the burden and

READ PAGE 537.

wrong of disfranchisement before it next adjourns, also specially requesting every Senator and Assemblyman from New York to use his utmost influence to secure the immediate passage of a law relieving of disfranchisement every women citizen in the State who lives by her own labor. The Society also indorsed a bill heretofore approved by several central unions enabling all self-supporting women to vote. This is a wholly new step by the organized working women.

ALE—ENGLISH AND AMERICAN.

An advertisement of a certain brand of English ale, which has lately been published, has attracted our attention, because it gives some apparently valuable information to consumers of ale. This advertisement, in stating the advantages possessed by this brand, enumerates among others that it is bottled in London, and never mixed with other ales. The inference is obvious that ales bottled in this country as imported ales are frequently mixed with American made ale, or perhaps entirely of American brewing. We believe that just as good if not better ale can be and is brewed in the United States; but if this is bottled and labelled as English ale, a higher price is demanded for it, and so far it is a fraud upon the purchaser to sell him American ale for foreign at an advanced price, though the American ale may be intrinsically the more valuable. The second point in the advertisement points strongly to another fraud upon the purchaser of imported ales, even if by good luck he buys real imported ale, and that is that the English brewers sell some thirty-five different qualities of ale—which of course are of different values—and the question arises, How can the purchaser know whether he gets the best quality of ale for the highest price? A third point relates to the treatment of the ale by the bottler. Does he allow it to ripen in the cask before bottling it? The fourth point relates to the clear and brilliant appearance of the ale, and here another consideration comes in. In England, as in all European countries, the consumers of ale and malt liquors do not drink the ale at as low a temperature as the American consumer does; therefore, an ale brewed for English consumption will not bear as low a temperature as it is invariably subjected to in this country. An English ale, brewed for English use, would become cloudy and muddy when chilled, as it is required to be here; and another thing, Americans demand a brilliancy of malt beverages that is far beyond anything required by Europeans. An ale rich in extractive matter cannot stand the chilling process demanded here, and never can be made as brilliant as the American taste requires. The consequence is that ale for American consumption has to be specially brewed for that purpose, and very naturally the really valuable qualities of a malt liquor have to give way to the appearance. It is for this reason that when Englishmen visit this country they invariably find that our imported English beers do not taste like those they have been accustomed to at home. In many cases, indeed, they express a decided preference for some of the better brands of American brewed ales. Such advertisements as the one we now refer to are sometimes very helpful in determining the value of the class of goods advertised.

CARNIVOROUS PLANTS.

PLANTS THAT DEVOUR AND ASSIMILATE ANIMAL FOOD.

The following discussion of one of the great wonders of the vegetable kingdom appears in a contribution by S. L. Clayes to the *Popular Science News* for October. There are certain plants which seize and prey upon insects. The fact of the capture is beyond doubt, and the plants which are capable of this feat are known generally by the name of fly-catchers. But while many fly-catchers can make no claim to being fly-digesters, there is among them a class of plants which, to all appearances, possesses the power of assimilating animal food and being nourished by it. One of the most conspicuous of this group is *Dionæa muscipula*, the Carolina catch-fly, or Venus fly-trap. It is a native of the Southern States, North Carolina being, I believe, the northern limit of its growth, and like so many of its species, it always finds its home in some bit of marshy land. To attain true success in its artificial cultivation a pot of bog earth is required, which should be kept constantly standing in a deep saucer of water. The appearance of this plant is so peculiar that when once seen it is not readily forgotten. A leafless scape, six inches in height, rises from the root, and terminates in an umbel of white flowers; these are, however, of distinctly subordinate interest. Its winged leaf-stalks spread themselves out like a kind of rosette about the root, each bearing a broad leaf, so curious in the strange powers which it displays as almost to convince that the plant can lay claim to a sentient life. The leaf proper is orbicular in shape, and has a hinge-like mid-vein, upon which the halves swing smoothly, opening and shutting with great speed and ease. Each half is somewhat concave upon the upper surface, and is bordered by a row of spines thickly placed around its outer edge, and set at such an angle as to cross when the blades are closed. They have, also, a power of separate movement, and interlock like the fingers of two hands. They remind one irresistibly of the teeth of a steel trap, which, in fact, they also resemble in the use for which they are designed. On the central part of each blade we find three conspicuous hairs. These are of the greatest sensitiveness, delicate, irritable, and so placed that even a small insect can hardly alight or move about upon the leaf without touching one or more of them. Over the surface of the blades are also strewn many small red globules, or glands, which are most numerous in the vicinity of the hairs. Provided the leaf upon which it grows be vigorous, no sooner is one of these irritable hairs touched—be it never so lightly—than the blades spring together, the spines cross at right angles, and presently a slightly glutinous secretion begins to flow from the red globules, which is supposed to be the active agent in the process of digestion. It is not improbable that the fluid from these glands may also serve to attract insects and cause them to alight upon the plant. While it is not well to often touch these hairs, and thus provoke the leaf to close—for much handling seems in a measure to weaken the powers—we can watch the action in other ways. On a warm day in summer we may reasonably count upon finding our fly-catcher with a keen appetite and alert for opportunity. Its red glands glisten in the sun, and a fly, espying the pretty sight, and maybe attracted, too, by some odor suggestive of delicate feasting, alights upon the leaf. Perhaps at his very first step he brushes against one of the sensitive hairs, when the two halves instantly close. Even were the process less prompt than it is, or the leaf imperfectly shut, the fly would be captured, for the interlocking marginal spines form such a network above the poor insect as to effectually prevent his escape. In his efforts to find a way out he will run up and down, and be sure again and again to come in contact with the hairs, which, proving each time responsive to his touch, even more tightly lock the walls of his prison about him; while the force of the contraction is so great that should he put forth all his power of strength it will be in vain—he cannot force them open. Now the leaf is shut, but on a close examination we find that the blades really touch only at their margins, and that a hollow space of considerable size is left open in the centre. By holding the leaf against the light we can see the imprisoned fly nervously moving about all over this space in anxious search for some means of deliverance. If he be not of too great size, the saucer-like form of his cell at first saves him from serious pressure. For a while there seems to be nothing more amiss with the little creature than being deprived of his liberty. When at the end of two or three hours this leaf has been forced open, he has usually, after a moment of bewilderment, been able to fly away as if all things were well with him. It is uncertain how long the captive may be held alive within these prison walls. I have seen one moving about after more than fifty hours. After an imprisonment of two days the fly has been liberated and found to be still alive; but the poor insect under these circumstances has never recovered. It is a hopeless task to attempt to save him when once he has been bathed in the fluid from the glands. Although he may be cleansed with the most delicate care, and every particle of the viscous stuff appear to be washed away, the poison seems to have entered his system, and the poor creature is doomed to succumb. When the fly is not removed, and matters are allowed to take their natural course, the two blades of the leaf continue to pass more and more closely together, until they actually touch each other, so far as the body of the insect—or what remains of it—will permit. The mucilaginous fluid discharged by the glands yields, upon examination, some formic acid, and it also contains a substance very like pepsin. By its aid a portion of the fly's body is digested, and the digested mass is absorbed by these same versatile red glands which produced the fluid, and which have in their interior certain formations that botanists call *stomata*, a name which is derived from a Greek word signifying mouth. The process of digestion in the plant, far from being hurried, is one of the greatest deliberation. The time occupied varies from one to three weeks, its duration being influenced somewhat by the size and vigor of the leaf, but far more by the kind of food which is being absorbed. Soft-bodied insects, flies, spiders, and those of like texture are more quickly disposed of than beetles and others which have hard or shell-like coverings, and small creatures disappear more speedily than larger ones of the same sort. The size of the insect thus caught and capable of being digested seems also to bear direct proportion to the size of the plant. Experiments tried upon an unusually large specimen of Venus fly-trap have been most interesting in their results. One leaf, measuring one and five-eighths inches in length from end to end, and three-fourths of an inch from mid-rib to edge, with spines one-half inch long and numbering nearly four dozen in all upon the two halves, caught and consumed not only formidable spiders, but a horny beetle as well. When the blades at last open through their own impulse, the viscid secretion of digestion has disappeared; the leaf is dry, clean and bright; the dissicated skeleton of the fly is ejected, and sometimes it is found to have been so firmly pressed between the blades as to leave its impression indented line for line, with great accuracy, upon their soft substance. The *Dionæas* will accept artificial feeding, and as readily digest some of the articles eaten by man as their own more usual diet of insects. Milk they seem to really relish, and in their leavy stomachs it speedily resolves itself into the orthodox curds and whey, which are afterwards absorbed—some nine days being required to dispose of the curdy part. But while milk seems to afford suitable nourishment—unless given in too great quantity—cheese they do not tolerate at all, the leaf to which it had been fed turning black and dying upon every occasion, whether the article offered was newly made or of the ancient and mouldy class. Salt, so grateful to the human stomach, proves a positive poison to these vegetable ones. The boiled white of an egg, however, they find quite to their taste. Small bits of raw beef are also accepted and apparently digested. When, after having been for two or three days exposed to the action of the digesting fluid, these morsels were removed from the leaf, they were found to have become white, tender and easily macerated, and showed not the least tendency toward a putrid decomposition. The Venus fly-traps,

however, by no means of a glutton-like habit, and a leaf which is overfed will surely die. But they generally know when they have had enough, and can no longer be tempted, the sensitive hairs refusing to respond, no matter how cunningly they may be manipulated. Another idiosyncrasy of the plant is that it prefers the victims of its own bow and spear to any that may be captured for it; and it manifests something very like intelligence in its quiet but persistent rejection of practical jokes offered in the guise of small pebbles, grains of sand, and other substances impossible to its digestion. Indeed, it may be termed truly refined in its tastes, when compared with other fly-catchers, notably the *Sarracenia*. These plants, after capturing their food in immense quantities, and of any sort that comes to hand, leave it to putrify within their pitcher-like receptacles, which reject nothing; and the plants subsist and thrive finely upon this revolting mass, which makes itself manifest by its foul odor for some distance around. Our *Dionæa*, on the other hand, being, perhaps—who shall say?—under some subtle influence emanating from the lovely goddess whose name it bears, is as tidy in habit, as fastidious in taste, as the most dainty of women. It closes its leaves, it is true, upon any foreign substance that may be placed within them, responsive, always to the irritation of the hairs; but unless it finds the matter enclosed in its embrace to be suited to its tastes or needs, it is as sure to be expelled as if the plant was possessed of reasoning power. When the experiment was tried of cutting off the sensitive hairs and thus removing them altogether from the leaf, it was followed at first by its closing; after a while it opened again, and then the action became as truly capricious as if the plant was endowed with will-power. Sometimes the leaf failed to respond at all when irritation was applied to the parts where the hairs had been; at others, the two halves came together just as they do when all is perfect; again, the action followed slowly and awkwardly when a considerable time had elapsed after the irritation had ceased.

AUTUMN LEAVES.

SIMPLY A CHEMICAL CHANGE IN THE COLORING MATTER.

Donald Mitchell, in one of his delightful essays, has characterized the brilliant display which marks the progress of Fall as the "Autumn miracle." Certainly there is much about this transformation of the foliage, this lavish spread and swing of color, that stamps it as such. The touches of this mystical painter for this year are already seen on the neighboring hills and woods. The pale greens and yellows, usually the first in order, have appeared, and the flush of the pinks in many places begin to deepen to a dead red. Science, with its learned explanations, has never been quite able to efface all the romance which surrounds this change. There is something interesting, to be sure, in the relations between the fruit and the leaf. They are really twin brothers, it seems, only the one has been given better opportunities than the other, and so makes the earlier show in the world. Their course in life, however, is the same. They mature, change color and then fall, alike. This fancied touch of the painter is only a chemical change in the coloring matter of the chlorophyl, and the flush on the cheek of the peach is not at all different from that on the Autumn leaf. This is science, but it does not afford half the pleasure that did the thought that it all was due to the sturdy breath of the north wind. However, cold weather has little to do with this work of transformation. One of the most brilliant Autumnal displays in the White Mountains was that of some dozen years ago. The whole sides of many of the hills seemed to have been converted into sheets of flame. Heightening the effect was a ground covered lightly with the fall of first snow, the scarlet hues of the foliage flashing within this chaste setting. The explanation was that the cold weather had set in unusually early, while the leaves had been late in ripening. Leaves are attached to their stems by a series of thickened cells. As these grow old and harden, the leaf is released and thus falls. Oak leaves, however, are not subject to this change of color or falling in the Autumn. They are like certain kinds of apples; ripening has no effect upon their appearence. Oak leaves this season present a dead and decayed appearance, while all their neighbors are flashing in the brightest raiment. Boston every year sends delegations to New Hampshire to witness the Autumn miracle. Notable in their devotions are many of the members of the Appalachian Mountain Club. Preparations are now being made for the Fall pilgrimage.—*Boston Journal.*

TROPICAL STORMS.

DESCRIPTION OF THE APPROACH OF A MONSOON IN INDIA.

Let me try to give a pen picture of the end of an India summer and the beginning of the period when the monsoon rains descend. Day after day the sun pours down withering heat, the air is sick with it, the ground is hard as iron, and gapes in great cracks, as though open-mouthed, pleading to the pitiless sky for a drop of water; the wide expanse of a country that a few months past was green and flower-besprinkled is brown, the grass crisped with a fierce heat and falling to powder if rubbed; the trees, mostly evergreens, are parched and dusty; no breath of air rustles through, no leaf stirs. They resemble great toy trees, with leaves of painted wood. There is no sound of life anywhere; the noisy, green parrots are silent, and hide from the sun in the heart of the densest and leaflest top. You may, perhaps, see a crow or a mynah sit solitarily on a bough, with drooping wing and gaping beak, helpless in this great purgatory of fire. "The monsoon, the monsoon—will it never come?" you ask as you toss half naked on your bed, worried by prickly heat and insects which shall be nameless, not the worst of which is the persistent blood-sucking mosquito. Heat apoplexy has, perhaps, prostrated one or two of your friends, and a second in the open air unhelmeted would be sudden death. "Will the monsoon never come?" Every evening the sun drops down in the west like a great ball of fire, but leaves the heat behind him. One evening you notice with great joy two or three black clouds climb up the east to take a peep at his descending majesty. They are the advance guard, you think, of the monsoon and it will surely rain before morning. Morning dawns, and the sun sets to blowing his heat furnace strong as ever; the sky is once more a great dome of burnished brass. The monsoon at last blows the warning trumpet, and the soughing of his wind to the far-away horizon calls you out from your bed to the veranda. Nature holds her breath; a great calm, a strange hush—the hush of expectancy—fills earth and air. Ha! here comes the monsoon. Away on the western horizon a great black cloud wave surges up toward the zenith, blotting out the burnished sky in its progress, just as though you poured ink slowly into a brass bowl. Behind this black wave, and moving with it, is a great dense ebon mass, cut, every instant by forked lightning and bellowing, deafening thunder. The quick darting adder tongues of flame flash everywhere, search the bellowing heavens throughout from top to bottom, throughout the whole cloud-packed dome. Now, for a second, only for a second, the quick-flashing lightning ceases, and an inky blackness, the blackness of Erebus, succeeds, and the thunder bellows as an Englishmen in his sea-girt little isle never heard it bellow. It is no distant rumble, gradually rolling nearer and culminating in a resounding crack overhead. No; around, about, and just over-head the infernal din never ceases. The bellied clouds are pregnant with thunder, and the flame forks flashing hither and thither pierce their wombs and loose the thunder from its prison. It reminds one of Michael and his celestial host warring with Lucifer and his legions. It is terrible. Inside your bungalow the first advancing wind that heralded the monsoon carried with it clouds of blinding dust, which is now piled up an inch high on table and chair, and shelf. And still the war of the elements goes on. You cannot hear your neighbor's voice, though he shouts his utmost; the birds, affrighted, shriek in the thickets, and the native servants huddle themselves together in dark corners for safety. The sky opens its floodgates, and rain in torrents pours down without intermission for eighty or ninety hours on the parched earth. Splash! Splash! on the roof—not in showers, but in sheets. This is the monsoon. And when it has passed what a transformation it has effected. The arid plain is one great lake, through which rise innumerable trees of glossy green, and crowding their leafy cathedrals flocks of parrots and mynahs chatter their thanks to God for the welcome rain. The great lake soon disappears, absorbed by the thirsty earth, and reveals a far and fair expanse of verdure beautiful beyond words in its dazzling greenery, and sprinkled with flowers that have shot up in a night, earth's embodied hymn of praise to the Creator for the blessing of the monsoon.

CIDER WITHOUT APPLES.

HOW THE ADULTERATOR CONTRIVES HIS CONCOCTIONS.

The *National Druggist* gives the following formula for imitating apple cider as closely as possible:

Powdered catechu	3 parts.
Alum	5 parts.
Yeast	32 parts.
Honey	640 parts.
Water	12,800 parts.

Let ferment for fifteen days in the sun (or other warm place), then add

Bitter almonds	8 parts.
Cloves	8 parts.
Burnt sugar	32 parts.
Good Bourbon whiskey	384 parts.

Let stand a day or two, and rack off. If it be too sour, add honey, and if too sweet, add acetic or citric acid to suit. The above makes a "cider" difficult to tell from that made naturally from apples. A good cheap imitation may be made as follows: Twenty-five gallons of soft water, two pounds tartaric acid twenty-five pounds of brown sugar and one pint of yeast are allowed to stand in a warm place, in a clean cask with the bung out, for twenty-four hours. Then bung up the cask, after adding three gallons of whiskey, and let stand for forty-eight hours, after which the liquor is ready for use.

ENGINEERS' CONVENTION.—The twelfth annual meeting of the American Society of Mechanical Engineers will be held at the house of the Society, 12 West 31st Street, New York, commencing Monday evening, November 16.

COAL AND AMMONIA.—It has been estimated that one ton of coal gives enough ammonia to furnish about thirty pounds of crude sulphate, the present value of which is about $12 per ton, and there being 10,000,000 tons of coal annually distilled for gas, no less than 133,929 tons of sulphate, of the money value of $1,607,148, are produced.

LUBRICANT WANTED.—Too many engineers behind the times still use tallow as a cylinder lubricant, says an exchange, and by so doing run a great risk of eventually destroying the engine, as the several fatty acids, stearic, oleic, margaric, etc., of which tallow is composed are almost sure to eat out the valve seat, piston rings and other parts of the cylinder. Some good mineral oil should be used, which is known to have a reputation.—*Invention, London.*

BRIGHT STORIES.

AN ARTIFICIAL MIRAGE.

ROBERT DUNCAN MILNE, IN "THE ARGONAUT."

While strolling one day, a week or two ago, with a friend, in the environs of San José, my attention was attracted by some unusual operation, which was going on in the grounds of a handsome suburban residence. The lane upon which we were walking was separated from the aforesaid grounds by a hedge and a broad fringe of hop-vines, beyond which, again, was a circular level space of, perhaps, two acres in area, from which the hop-vines that had formerly covered it had been nearly all removed by a gang of laborers, who were evidently nearing the completion of the job. One of the unusual features of the operation was that the hop-vines that were being removed gave promise of yielding a plentiful and therefore valuable crop of blossoms; another lay in the fact that several acres more of hops, immediately surrounding the cleared area, were left untouched. I confess that my curiosity was piqued to imagine a cause for so singular a proceeding. Neither could my companion, Harkness, venture a reason for it. It was evident, moreover, that considerable care was being used in clearing the area to a certain scale, as a stake was driven into the ground at its centre, to which a rope was attached and stretched to the periphery of the area, the other end of the rope being held by a gray-bearded man, in a white duster, who was slowly pacing off the limit to which it was clearly intended the hop-vines should be cleared.

"Maybe the old fellow's a horse-breeder," suggested Harkness, at length; make a capital training course for horses, wouldn't it?"

"But it's a good hundred yards across," I returned; "breeders don't want Roman amphitheatres to speed horses in. Besides, consider the expense of the amusement in the present instance. No; we must try again for a reason."

"Eccentric, to say the least, whoever he is;" and we passed on in the direction of the town.

Some little distance further on we came upon a man at work upon a hedge on the other side of the lane, whom we asked regarding the identity of the person we had been discussing.

"Oh, old Dr. Wyman, you mean," said the man, smiling. "Yes, people say he's a little cracked in the upper story. Smart man, though. I've heard said he could give them fellows up Mount Hamilton way pointers upon science. He's got telescopes and microscopes and such like up in his house would do you good to look at if you're interested that way."

"It might be worth our while to drop in on the old fellow," remarked Harkness, as we passed on; "I'm curious to know what that big circular space is being cleared for, anyway."

Accordingly, we made an appointment, when it would be convenient for both of us to walk out in that direction again, and one day last week found us once more on the way to Dr Wyman's residence. From inquiries made meanwhile in the town, we had learned that the gentleman in question had only recently arrived in San José, and that he was reputed to be a man of considerable means, having paid a good round sum to its former owner for the place he occupied.

Passing through the entrance-gate, a walk of about a hundred yards through a well kept orchard brought us to the door of a neat and commodious one-story residence, the trim flower-beds and grass-plots surrounding, which gave evidence of refinement and culture on the part of those whose home it once had been. A good and sufficient reason for our paying what might otherwise have been construed into an intrusive visit to an utter stranger, lay in the fact that Harkness, who is something of a microscopist, could not make a sufficiently exact examination of some forms of infusoria that he had chanced upon in the neighborhood, with his own instrument, and hearing that Dr. Wyman possessed a lenticular microscope of very high power, and the newest construction, had called to see whether he might not be permitted to use it for the purpose named.

Dr. Wyman received us cordially, and readily put his instrument at my friend's service, at the same time leading us into a large apartment which he called his observatory, and in which many optical and other scientific instruments were arranged within cases or stood upon tables, besides a very fine six-inch equatorial, pointing upward toward a shuttered aperture specially provided for it in the roof. After spending half an hour or so in conversation, and arranging a time at which Harkness should call with his specimens, we prepared to go, our host putting on his hat and accompanying us out into the grounds. The path to the gate led us close to the growing hop-vines surrounding the cleared area before described, which was with difficulty discerned through the thick growth. I could not resist the impulse to ask the meaning of the peculiar clearing which had so excited our curiosity in the first instance, and had been indirectly the cause of our present visit.

"Ah! you have noticed the clearing I have had made in there," said the doctor, stopping and motioning toward it; "and you, no doubt, wonder what can have possessed me to sacrifice a profitable crop at such a time and in the manner I have done. Well—I do not know whether I should be doing myself justice—perhaps exposing myself to ridicule—by explaining the exact purport—going into particulars about the intent and scope of what I propose to accomplish—have very good reason to believe I shall be able to accomplish."

Our host spoke with hesitation, and, at the same time, with a deliberation which showed that he was weighing every word carefully before giving it utterance.

"It is not that I have not full confidence in your discretion not to give a premature or garbled account of what I purpose doing. It is rather that I am not ready—have not yet completed my preparations and—you know the proverb about the injudiciousness of letting people see things half done," added the doctor, smiling. "But," he went on, abstractedly, "there can not be very much harm in giving you some slight idea of the matter. I must have witnesses sooner or later, and nothing would please me better than the presence of gentlemen of intelligence, like yourselves, who would allow for imperfections, even failures, of result, if these should unfortunately turn out to be the case. Come with me, then," he added, abruptly, after a pause; "I can show you what has been done, and, perhaps, be able to explain what I mean to do."

So saying, our host led the way through the rows of hop-vines, till at length we emerged upon the circular, open clearing.

If the mere spectacle of the clearing of the large circular area, which had excited our curiosity two weeks before, was peculiar, that which was now presented to our gaze was perfectly inexplicable. Before us lay spread a circular apace, about one hundred yards in diameter, surrounded by hop-vines seven or eight feet in height. Dr. Wyman led the way across this area, and, to my astonishment, I saw that trenches, about a foot in width and the same in depth, had been dug across the whole of the area from north to south, about six feet apart from each other, and that lengths of cast-iron piping, a foot in diameter, such as is used for large gas or water-mains, had been laid along the trenches, so that their upper sides were flush with the surface of the soil. The castings were connected together, in the usual manner, by joints, some ten feet apart, and, in the centre of each length, there was a circular orifice about an inch in diameter. At five nearly equidistant points at one side of the circle, where the piping ended, were set as many engines of a peculiar type, and as we passed round the circle, near where they stood, I could see that the pipes, of which there were fifty rows, were connected in sets, varying from twelve to eight, according to their length, by a transverse pipe ending in the boilers aforesaid.

"There is nothing complicated about the apparatus, you see," remarked the doctor; "these," pointing to what I thought were engines, "are merely generators of caloric. The hot air, generated by the furnaces, is forced by fans through that system of piping. The other ends of the pipes are closed, so that there is no escape for the hot air except by the vent-holes you may have noticed in the pipes. The work has cost me a good many thousand dollars, but I shall be amply repaid if the result meets my expectations. It will be a day or two yet, however, before all my preparations are complete, and then I hope you will favor me with your company to witness the *denouement*. To day is Wednesday. What say you to Sunday next? Agreed! Then if you will accompany me to yonder arbor, out of the heat, and can spare a few minutes, I will try to give you some idea of what this apparatus is for and what has led me to have it constructed in the manner you see."

Our host then led the way to a rustic arbor, where, in the cool shade of the trees, he began the following narrative:

"A large portion of my life has been spent in traveling; in fact, there are few quarters of the globe that I have not visited in my time. Such sojournings, for whatever purpose they may be made, only become interesting when one uses one's faculties of observation in examining and analyzing such objects of interest as may present themselves; in one place it may be the manners and customs of a savage race: in another, some sublime specimen of architecture; in a third, some new form of botanical or insect life—in short, to the observant eye every phase of nature becomes an object of interest. Among other things, the wonderful natural phenomenon known as the mirage had frequently arrested my attention and taxed my ratiocinative faculties to account satisfactorily for its appearance at certain times and in widely varying conditions and forms. The theory laid down in scientific works satisfied me in part but not in whole. The illusive appearance of a lake upon a desert, for instance—the commonest form of mirage—is easily accounted for on a theory that a layer of heated air, near the surface of the earth, acts as a mirror at its plane of junction with a denser stratum superimposed upon it, and reflects the forms of animals, trees or other objects in the field of vision, just as a veritable sheet of water would do. In the same manner, I could reasonably account for the image of an inverted ship, suspended in the air directly above a real one, on an ocean horizon, the point of junction of the differing atmospheric strata being, in this instance, above the ship's masts.

"But this simple and comprehensible process of reflection would not account for the phenomenon known as *looming*, wherein an island at sea, or a bluff on a desert, appears as though but a mile or two off, whereas its true position may be ten times that distance away. I have seen, for instance, the city of Melbourne as though but a few miles off, when it was actually out of sight below the horizon. Still less would this hypothesis account for such scenes as I have witnessed on the Nubian Desert—cool, limpid pools of water, fringed by green, waving palms, with camels browsing in the shade, the veritable reproduction of an oasis which I afterwards reached and recognized, and which was then nearly two hundred miles away. More than this, upon the same desert, I have seen the city of Damascus, with its sparkling buildings, rich corn-fields, and blooming orchards, spread out before me as vividly and distinctly as I have seen it from the eastern slope of Anti-Libanus, though in a bee-line it was at least a thousand miles away.

"Imagination, you will say? The effect of intense heat upon a strained nervous system? Physiologically plausible under such conditions, I admit, but not in another I can name. In July, 1866, from a window in my residence in Chicago, I saw the city of Grand Rapids, Mich., projected above the waters of the lake so clearly that I could distinguish streets and public buildings, though one hundred and thirty miles of water and land separated the one city from the other. Not only was this spectacle witnessed by myself but by thousands more. So much public interest and comment did it excite, that it formed the basis for a number of scientific articles in the local publications of the day.

"But to come to the point where, in my case, hypothesis ended and practical knowledge began, in the matter of accounting for this apparent annihilation of distance and upsetting of known optical laws and existing theories regarding the transmission of light, I must give you an account of my recent experience on the Mojave Desert—an experience which has led directly to the construction of the apparatus you have just seen and to the experiments I am about to institute.

(*Concluded next week.*)

LAGER BEER.

HOW GAMBRINUS BECAME ITS TUTELARY DEITY.

The first mention that history makes of beer brewing, as being carried on in a professional way, was in the year 812 A. D., at the time of Charles the Great, who, among other industries, fostered that of the brewing of beer. Before that time none but distinguished citizens had the right and privilege to brew, which right was inherited from father to son. It is pleasing to know that in those "good old times" the lady of the house attended to the beer for the household with as much interest as our present housewives give to coffee for our breakfast tables. In the division of an estate, all brewing utensils, etc., rightly belonged to the lady of the house. Later on brew houses were built in every town, and every family had certain days appointed for them in which to do their brewing in this rather of a "co-operative" brew house. At that time, which was in the ninth century, the monks took particular interest in the brewing of their beer. Those monks always managed to live well. They had a supply of everything that was good, and they particularly enjoyed a mug of beer of their own brewing. It was in the ninth century also when beer was first offered for sale as an article of commerce. As a rule, it was sold at the inns, where the people gathered before and after the church services, to enjoy themselves around the tables. (We should have mentioned the fact that the inauguration of beer selling in Germany was at the church festivals which frequently occurred, and at which were gathered people from far and near to see the sights so to speak.) It seemed to be the calling of those ancient bishops and monks to teach the art of beer brewing as well as Christianity, in fact these were the first professional brewers known. In 816 A. D., when the convent of St. Gall was rebuilt, it was found that, on the same premises, there was a large brewery with all the improvements (known at the time), such as malt kilns, brew house, cooling room, etc., even a thoroughly constructed cooper shop. It was in this convent brewery that hops were first used in the manufacture of beer. Under Charles the Great, the brewing industry, and in fact all mechanical industries received a great impetus, and continued rapidly to advance in importance, so that by the eleventh century the brewers of Bremen were exporting, and one could get Braunschweig, Halberstadt, Gosler, Stade, or Bremen beer on draft in Bremen, which goes to show the great advance the industry made in its infancy. Bremen beer, however, was considered everywhere to be the best; such beers as Muenchen, Weiner and Pilsner, being unknown in those days. But the royalty still seemed to cling to the old way of brewing their own, as every royal residence was fitted up with a complete brewery, which was considered as important as other necessary buildings, such as the stables, prisons, etc. The castle of Wartburg, built in 1067–1075, had on its premises a brewery 50 x 30 feet; Koeln (Cologne) had over 600 wealthy merchants exporting to England, Norway, and the Netherlands, beer and wine being the principal articles shipped. In 1146; Bavaria granted its first brewing privilege to the convent of Weidenstapen; their hops had to be imported from Klattau. In less than no time large cities came into existence throughout Germany, such as Nuremberg, Constanz, Wien, Breslau, Bernau, Berlin, Zittau, Erfurt, Worms, Aachen, Metz, Frankfurt, Sachenhausen, Regensburg, and many others; in all of these brewing was one of the largest industries, and beer was sold and exported in large quantities, at the price of one pfennig (one quarter of a cent) per maas (about one quart). Up to 1259 brewing was carried on by parties who were engaged in other pursuits as well; but the first man to engage himself exclusively in the business was "Arnold the Brewer," who, in 1259, located his business in Strasburg. In 1290 the authorities of Nuremberg passed an ordinance that beer must be brewed from hops and barley only, no other grain to be used; but adulterations were readily practiced, though the offenders were severely punished. Take, for instance, the law passed by the authorities of Aachen: "All men brewing or selling beer shall pay a certain tax and shall brew their beer from hops and barley only; whoever shall neglect to obey this law, if proven guilty, shall have his right hand cut off and shall not be permitted to live within the limits of the city for five years after sentence, and the house where such illegal beer has been brewed or sold shall be destroyed at once." For many years later the adulteration of beer was punished by cutting off limbs from the body of the offender, or by destroying of the sight with irons at a white heat. In Breslau all hops to be used for brewing purposes had to be duly inspected by the authorities, and the mixing of poor with good qualities was severely punished by law, even as far back as the thirteenth century. It was at about that time the brewers' guardian angel (Gambrinus) came to light. Gambrinus (his right name being Johann I.) was born in 1251, and was the son of Henry III. of Germany. The Latin name of Johann I. being Janprinus, and as all documents were recorded in that language, he was generally called Gambrinus. All the brewers' societies then in existence chose him as their "guardian angel," as he gave them full freedom throughout the land and fostered the industry in many ways. His picture or statue can be seen in almost every brewery at the present time, as he is the recognized god of "Lager."—*N. E. Exchange.*

BATHING IN PARIS.

HOW THE AVERAGE FRENCHMAN MAKES HIS ABLUTIONS.

An American familiar with the fact that every house or apartment renting as low as $300 per year in the United States has its own bath tub, with hot and cold water supply and waste to remove the contents of the tub, is amused if not amazed when, on a visit to Paris, he gets an idea of the custom still prevailing in that metropolis of luxury and elegant buildings. The large hotels, some very costly private mansions and apartments, and the public bath-houses have their bath-rooms, as is the custom in the United States, though the French bath-room is usually much larger and is elegantly furnished with rugs, lounges and dressing tables, etc., the idea being that if one takes a bath one must lie down and take a nap after it. People living in apartments costing as high as $1,000 a year, and in the new quarter of Paris in the neighborhood of the Champs Elysees, when they wish to bathe other than take a sponge bath in a small portable tub, either go to the public bathing establishments or send to them to have a bath brought to their apartments. Sunday morning one sees a strange-looking, two-wheeled cart, like a very high dog-cart, on which there is a framework built over the wheels. This framework can hold three bath tubs. They are made entirely of copper, and are about five feet long, about twenty inches deep at the end, and eighteen inches on the side. The driver of this vehicle is perched up high on a small seat in front, is bareheaded and wears a blouse. On each side of him an iron ring encircles a copper-colored vessel holding about three gallons of hot water which rests on a little shelf. He also carries a supply of dry towels and sheets. The bathing establishments have these carts, and when a patron sends word that he wants a hot bath at a certain hour the bath is put on the cart, the kettle filled with hot water, and the cart with its strange load is rapidly driven to the building in which the apartment is. The driver carries the bath tub, as an Adirondack guide carries a canoe, on his head and shoulders, from the first to the fifth floor as the case may be, and after spreading a sheet to protect the carpet he spreads also a clean sheet inside of the tub, so that the bather does not touch the metal. Then he carries up the kettle of hot water which he has brought from the main establishment. The necessary cold water he gets on the premises. The charge for this is about sixty cents, with the usual additional tip to the man.

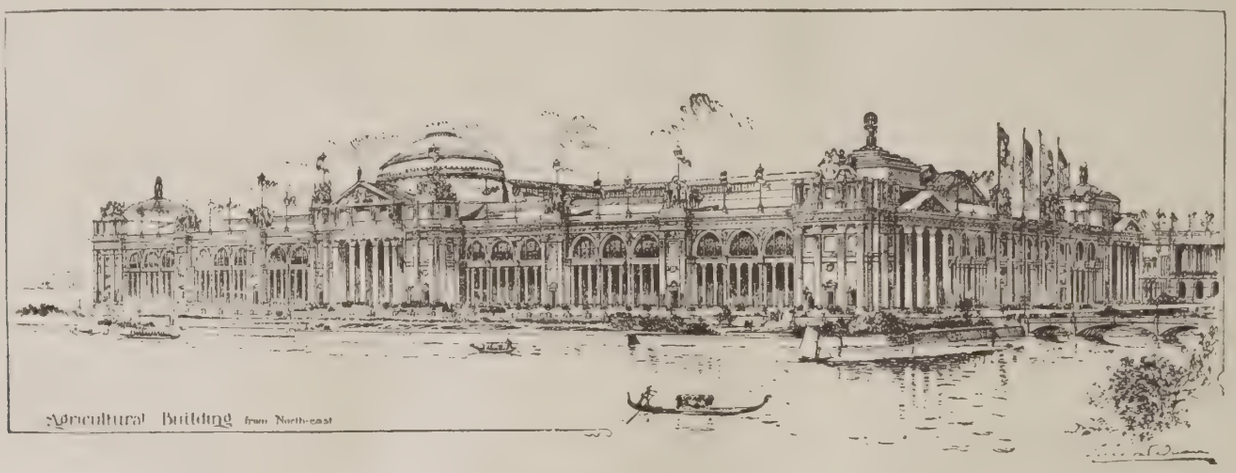
ASTRONOMICAL CONJECTURES.

A BRIEF SPECULATION ON THE MOTION OF THE STARS.

The Pleiades are visibly a group. Throughout ancient history they are represented as seven stars, wanting one. In our own day that small square of sky space over which this cluster of half a dozen is scattered, has been found to be occupied by many more than 2,000 suns. The distance of the group from us is estimated as at least 1,500,000,000 miles, and it is estimated that Alcyone, the chief of its stars, must a thousand times excel our own sun in brilliancy. Now, in regard to this goodly company, there is evidence that the majority have an apparent motion in common. But that which is true of most of this wonderful crowd of worlds is not true of all the individuals that at first seem to belong to it. A few are found to lag behind, while two at least hurry on in advance of the general progress. These sets, then, do not in fact belong to the cluster, but, being situated far beyond or far in front, take their places in the same apparent plane only through the effect of perspective. The question may naturally be asked, What can produce this appearance of motion either in the stars of the group or in the stars before and behind it? It must be produced by reality of motion somewhere, either on the part of the stars themselves or else of another star, the sun with which we are ourselves identified, or else on the part of both combined. It is obvious that if our solar system is in motion, the other solar systems of the sky are likely to be in motion also, and *vice versa*. Thus we might expect that the apparent movements referred to would be a mixed result, and this is found to be the case. The displacements of the stars are analyzed into what is called "the *motus parallacticus* optically transferred to the whole stellar multitude from the single real motion of the sun, and the *motus peculiaris* belonging to each individual star."

Slowly, as slowness is counted in celestial things, our sun is moving towards such and such a point in the heavens. This inference is drawn from the fact that thousands of variously situated stars are found to have a drift in the opposite direction. But this drift does not account for the whole of their movements and when that part of the movement which is common to all has been subtracted, the residuum, in whatever direction it may happen to be for each, is set to the account of the star's own progression.—*The Edinburgh Review.*

DEEP WELL.—An artesian well 3,095 feet in depth has been sunk at Ashland, Wis., at a cost of $14,000. After the first 175 feet it passes through brown sandstone.



PNEUMATIC SOLES.—A pneumatic inner sole or sock for boots and shoes has been brought out to confer great benefits upon people who have tender feet, etc. It is made of hollow India-rubber, inflated with air or gas under pressure, the external protective covering being canvas, linen, skin, or other suitable material, to adopt it to withstand the internal pressure of the compressed air or gas.—*Invention, London.*

FLASH LIGHT.—Many uses have been proposed for aluminum, and in some instances this metal has been brought into actual use. One of its latest applications is in the making of photographic flash lights in the place of magnesium. A mixture of powdered aluminum and chloride of potash is said to give a brilliant flash without the smoke that is produced by magnesium, and this quality is in itself a strong recommendation.

THE COLUMBIAN EXPOSITION.

THE AGRICULTURAL AND ELECTRICAL BUILDINGS.

We continue, for the edification of THE AMERICAN ANALYST'S readers, the illustrations of the buildings now in progress for the Columbian Exposition in Chicago in 1893. With the exception of the Administration building, the Agricultural building will be the most magnificent structure on the exposition grounds. In size it is 800 by 500 feet, severely classic in style.

THE AGRICULTURAL BUILDING.

It is almost surrounded by lagoons. The features of this building are its five pavilions—one at each corner and one in the centre. The corner pavilions are 64 by 48 feet. The grand entrance is on the north. It is 60 feet wide, leading into a vestibule 30 feet deep and 60 feet wide. At the entrance are Corinthian columns 5 feet in diameter and 40 feet high. Beyond these massive columns is the rotunda, 100 feet in diameter, surmounted by a glass dome 130 feet high. There are 8 minor entrances, 20 feet wide. The roof will be principally of glass. The Electrical building covers a space of 700 by 350 feet, or more than five and one half acres. Like most of the other buildings, the style of architecture is Italian renaissance. It is 60 feet high, and ornamented with designs suggestive of the department. It is one of the handsomest of the grand central group, and will cost $650,000. There will be four entrances to the building, the main one on the south. It will be built of a material resembling granite in color. A statue of Franklin will rise conspicuously before the south entrance.

THE ELECTRICAL BUILDING.

WORLD'S FAIR NOTES.

The Royal Agricultural and Commercial Society of British Guiana has decided to hold a local exhibition of its resources preliminary to the display it intends making at Chicago.

The imitation battleship *Illinois*, at the naval pier, in the Exposition grounds, is now rising from the water. Work is progressing satisfactorily on the hull. The deck will measure over all 348 by 69¾ feet. This structure is to cost $100,000, and is the most original illustration of naval architecture ever worked out. We illustrated it last week.

A company has been formed, embracing several very wealthy men, to inaugurate and operate in Chicago a permanent circus, after the style of the Hippodrome, in Paris. A building with seating capacity of 5,000, and having a garden on the roof, will be erected, and the attraction will be in operation to entertain World's Fair crowds.

Charles W. Rolfe, of the Illinois University, at Champaign, has been elected to take charge of the relief map of Illinois, which is to be a part of the State exhibit. He will be assisted by a corps of ten engineers, who will go in the field soon. The map is to be made on a scale of one inch to three miles. It will be six by ten feet, and cost $15,000.

One of the largest bicycle factories in America has written to Chief Smith, of the Transportation Department, that it will exhibit at the Fair "bicycles and tricycles of every style of the trade, showing the rise and progress of the art of making 'wheels,' from the first 'bone shaker' built in this country up to the highly finished 'safety' of the present day."

Chief Ives, of the Art Department, now in Europe, writes most encouragingly concerning the prospects of the art exhibit at the Exposition. He has conferred with artists and art societies in many of the principal cities of Europe, and has found them greatly interested in the Exposition, and anxious to send paintings and other art productions for exhibition. He reports his success much greater than he anticipated.

A stock company, with a capital of $100,000, has been formed, to place a paper exhibit at the Columbian Exposition. Every American paper maker or American manufacturer of paper making machinery will be allowed to take stock. The entire capital has already been secured, but the pledges will not be called for until the outsiders have been given a chance, in order to do away with any idea of a money-making scheme. A committee of five has been appointed by President M. J. Fitch to take the matter in hand, and to send a representative to the meeting of the Boston Paper Trade Club, the third Wednesday in November.

All of the restaurants in the Mines and Mining and Electricity buildings will be in the galleries. This was determined in order to leave the ground floor free, as far as may be, for intending exhibitors. It is thought, also, that restaurants on the second floors of the building would prove an attractive feature. It was also decided that the restaurants in the Electricity building be located in the two bays at the north end of the hall. In each bay there is to be one large dining-room, surrounded by several smaller rooms twenty-three feet square. The balcony connecting the two is to be fitted up for serving temperance drinks and ices. In the great Manufactures building about 40,000 square feet have been set apart for restaurants.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEATS.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUITS.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

DEVILLED BACON.—Make a dressing of mustard, oil, and red pepper. Cut some breakfast bacon into very thin slices, pour the dressing over them and fry.

COCOANUT BLANC MANGE.—Put one half pound cocoanut to soak in three pints milk for half an hour. Soak three large tablespoonfuls of gelatine in six tablespoonfuls of water and when soft add the milk and cocoanut and a teacup of sugar and boil for a few minutes, then flavor with a little grated lemon rind or vanilla; pour in a mould and set away to stiffen.

RICE CREAM.—Boil one cup of rice in milk until it is soft, adding to it two tablespoonfuls of sugar and one quarter teaspoon of salt. Pour it into a glass dish and when cool put lumps of currant or other jelly over it, make a meringue of the whites of five eggs beaten to a stiff froth, sweetened with three tablespoonfuls of powdered sugar, flavored with vanilla or lemon and a large tablespoonful of very rich cream beaten in. Spread this over the rice and serve.

CUP PUDDINGS.—Beat together the whites of five eggs well beaten, one cup of very rich cream, one teacup of sugar, one teaspoonful of baking powder and sufficient flour to make a cake batter, and a little salt. Bake in buttered stone-china cups in a moderate oven; when done loosen from the sides of the cups with a thin, sharp knife and serve on a napkin with hard sauce.

VENISON STEAK.—Cut a thick steak from the leg, rub in oil or butter and broil it, then lay it on a hot dish, squeeze a little lemon juice over and serve with the following sauce: Reduce a gallon of strong soup to a quart by long boiling, and keep it warm. Beat up the yolks of four eggs, turn them into a buttered saucepan, whisk them, and gradually add a pint of the reduced soup; add, while whisking, a tablespoonful of vinegar strongly flavored with garlic (or, if liked, a quantity of the juice from bruised garlic or shallots), and the juice of a lemon. After beating the eggs stir them in the pan continually with a wooden spoon, and do not let the sauce boil at any time: when smooth serve. A few mushrooms may be added to the sauce if desired.

BREAD PUDDING.—Beat up one quarter of a pound sugar with one quarter pound of butter and four eggs yolks, then add one quarter pound of very fine dry bread crumbs, beat up the whites of the eggs very light and add them; then bake and serve with a cream sauce.

HORSERADISH SAUCE.—Rub the yolks of two hard boiled eggs quite smooth with a little vinegar, then add equal quantities of thick cream and salad oil, a little sugar, salt and pepper. Have ready a stick of grated horseradish which add to the mixture and add lemon juice or more vinegar to taste. Serve with fish or cold meats.

MUSTARD.

Every one thinks that he knows what mustard is; nearly every one has seen jars, cans or boxes labelled mustard at the grocer's and druggist's, and many who may never have used the article as a condiment have had a far more unpleasant experience with it in the shape of a mustard emetic or plaster. Yet, if the truth is told, very few know anything about that much employed and valuable article. Mustard, as it is generally sold, is a fine powder made by pounding or grinding mustard-seed produced from several different species of the cruciferous genus *Brassica*. Of these the principal are the black or brown mustard, the white mustard, and the Sarepta mustard. A very fine quality of both the black and white mustard are cultivated in the Eastern counties of England. The black mustard is a plant requiring a very rich soil, and much care in its treatment. The seeds, which are very minute, weighing not more than one-fiftieth of a grain, are the most valuable. The peculiar pungency and odor to which mustard owes much of its value are due to an essential oil, developed by the action of water on two peculiar chemical substances contained in the black seed. These bodies are a compound termed by its discoverers myronate of potassium, but since called sinigrin $C_{10}\ H_{18}\ Kns_2\ O_{10}$, and an albuminoid body, myrosin. The latter substance, in the presence of water, acts as a ferment on sinigrin, splitting it up into the essential oil of mustard, a potassium salt and sugar. As this reaction does not take place in the presence of boiling water, it is not proper to use very warm water in the preparation of mustard. The seed of white mustard contains, in place of sinigrin, a peculiar principle called sinalbin, $C_{30}\ H_{44}\ N_2\ S_2\ O_{16}$. This, in presence of water, is acted upon by myrosin, which is also present in white mustard, splitting it up into sulphocyanate of acrinyl, sulphate of sinapine and sugar. This sulphocyanate of acrinyl is a powerful rubefacient principle, whence white mustard, although yielding no volatile oil, forms a valuable material for mustard poultices. The seeds of the Sarepta mustard, which is extensively cultivated in Russia and the East Indies, have the same constitution and properties as black mustard. Both as a table condiment and in medicine mustard has been used from the remotest antiquity. It was known by Hippocrates. The form in which table mustard is now sold dates from 1720, at which time Mrs. Clements of Durham hit on the idea of grinding the seeds in a mill, and sifting the flour from the husk. The bright yellow mustard flour thus produced, under the name of "Durham Mustard," pleased the taste of George I., and rapidly attained wide popularity. As now prepared for commercial purposes mustard consists of a mixture of the black and white mustard flour in varying proportions, and with more or less admixture of wheaten and buckwheat flour. This is partly done to make it keep better, and partly to overcome the unmitigated bitterness and sharpness of flavor of pure mustard. Some of these mixtures are honest enough in their intention, but being handled by inexperienced manufacturers, nearly always come short of their purpose. A great deal of dishonest adulteration is also resorted to, so much so that chemical analysis has shown that hardly ten per cent. of all the mustard sold in the market is free from adulteration. All varieties of mustard-seed contain from 25 to 35 per cent. of a bland inodorous yellow-colored fixed oil, free from pungency, and with little tendency to become rancid. It is extensively used for cooking and all ordinary purposes. The mustard papers commonly used as rubefacients and vesicants are made from mustard flour entirely deprived of its fixed oil. One of the descendants of Mrs. Clements of Durham was J. D. Herron, who was carrying on an extensive mustard factory in London as far back as 1830. About the year 1852 he sold out his business and emigrated to the United States, to open a large house. On his arrival he met Mr. William G. Dean, the present head of the firm of William G. Dean & Son. This acquaintance led to a partnership for the manufacture of mustard by the old English process, which had been so successful in Europe. As usual, Yankee ingenuity quickly mastered the subject, until improvement after improvement, under many patents, have enabled Mr. Dean's inventive genius to manufacture a mustard which, while it keeps in all climates, has none of the drawbacks possessed by all other mustards, and have justly led to its general adoption in every part of this country. The trade-mark name selected by Mr. Dean is as novel and well adapted as his mustard is superior to all others. Mustard should be ardent, and Mr. Dean's best mustard, therefore, is "Ardenter." Mr. Herron died, and Mr. Dean bought out his widow's interest, and ever since has conducted the business with the aid of his son, who is his partner, under the firm name of William G. Dean & Son. They are now located in an immense building at the corner of Washington and North Moore Streets, but are already crowded for room and looking about for a still larger building, to enable them to fill their orders, which are always from one to three months behind. The head of the firm personally superintends the factory and office, while the son is the popular salesman, and supervises the corps of salesmen employed. In every competition this firm has always been awarded the first prizes. The Government, after several careful analyses of the various mustards in the market, are among Mr. Dean's largest customers. This brand is well known by every jobber and wholesale grocer, and there can be but very few grocery stores encountered now where the "Ardenter" cannot be found, because when the "Ardenter" once becomes known, consumers will take no other brand. Messrs. Dean also make other brands and qualities of mustard to suit all trades The only other article manufactured by them is licorice; they are, therefore, undoubtedly the largest mustard manufacturers in this country if not in the world.

ON GETTING YOUR FEET WET.

A feature of civilized life is running to extremes. The average man in trying to avoid one evil goes as far in the opposite direction as to fall into another and a worse one. To avoid the generally unavoidable experience of getting the feet wet in rainy or snowy weather, we cover the feet with rubbers, arctics, and the like. These do harm when worn for any length of time. They heat the tissues of the inferior extremities and draw the blood to that part of the body until every vessel is distended. People must realize that the feet need ventilation and a cool temperature. The most beautiful feet and ankles of the world are those of the Irish peasant girl, the Egyptian water carrier, the Spanish vineyard laborer and the Italian shepherdess—none of whom ever touched a shoe or a stocking. But is there no danger of cough, cold or other ill? There ought to be none, and there would be none if people were healthy. But they are not healthy and getting the feet wet is too often the door by which disease enters. Yet it is not the wetting which causes the cold. Miners work all day in wet shafts and galleries; sailors in stormy voyages are never dry an hour during weeks; country boys play in the rain and snow as merrily as in the sunshine; all these classes are strong and vigorous. Any one whose system is in splendid condition can walk with his boots full of water or run bare-footed through the snow without taking cold or showing other ill consequences. Catching cold shows that the body is in poor condition. Any one who takes cold under such circumstances or who is fearful of it needs a renovation of the physical system. The humors require expulsion, the tissues purification, and the vital functions invigoration. Hot baths according to the person's strength; a cup of boiling water to be drunk by aid of a tablespoon on rising in the morning; a liberal use of fruits and such vegetables as the tomato, green pea, onion and lettuce; all these are of the highest value for the cleansing of the system, pores and bowels. But to

properly purify the tissues and revivify the vital functions can best be accomplished by a slow and steady treatment with Ayer's Sarsaparilla. When introduced into the stomach, it is promptly absorbed by the lacteals and poured into the blood. Here it begins its labors by attacking foreign bodies and decayed molecules; from the blood it enters the great organs and when, as is nearly always the case, these are sluggish, it stimulates them to normal action and efficiency. In this wise it completes the work started and going on in the circulation. According to the condition of the sufferer's system, the restoration to health is slow or rapid. The greater the ailment the slower the cure. When the system is again in full strength and vigor, it makes no difference whether your feet are wet or dry, cold or warm. You catch no cold under any circumstance. As a matter of economy and convenience, not to speak of comfort and physical well-being, Ayer's Sarsaparilla is better, cheaper, pleasanter and wiser than all the galoshes and waterproofs of modern civilization

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Relieves Mental and Physical Exhaustion. Dr. W. C. HANSCOME, Minneapolis, Minn, says: "I used it in a case of acute rheumatism, during convalescence: the particular symptoms I wished to relieve were sleeplessness and nervousness, and the results were all I desired."

NORTHERN LIGHTS.—The theory of the light of the aurora borealis was evolved from the analysis of its light by the spectroscope, which showed that it was caused by electrical discharges among the particles of meteoric dust in the atmosphere. The broad red line of the spectrum of iron is shown in all these cases and thus upholds the theory, as it is well known that the principal part of meteors is metallic iron.

A Tonic

Horsford's Acid Phosphate.

A most excellant and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

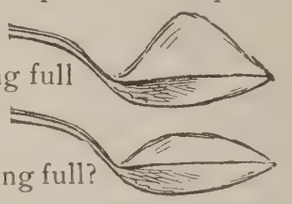
Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

THE TOMATO.—No vegetable has undergone a greater development in the last generation than the tomato. Persons who still esteem themselves young will remember the time when the only tomatoes to be seen were the small round or oval ones called love apples and deemed inedible. They seem to have been appropriated for table use first in this country, for an old European traveller tells how he astonished his fellow diners at a continental table d'hôte by eating the tomatoes placed on the table purely as garniture.

AS SHE IS SPOKE.—Europen hotel-keepers are, as a rule, not proficients in the English language—to put the matter mildly. Perhaps the greatest sinners are the Swiss landlords, who perpetrate some choice blunders. A delicious example of "English as she is wrote" may be seen and laughed at in a hotel on the Rigi:—"Misters the venerable voyagers are advertised that when the sun him rise a horn will be blowed." That announcement sufficiently prepares the visitor for the following entry in the wine list:—"In this hotel the wines leave the traveler nothing to hope for."

THE LABRADOR FALLS.—Canadian explorers have claimed that Labrador had a fall 2,000 feet high on Grand River. The Bowdoin College Labrador exploration party report a visit to the falls in July, in which they say that the Grand River Falls measure 200 feet, and that the rapids leading to it increase the total to 500 feet. Above the falls the average width of the river is 500 yards, narrowing until it reaches the falls to a width of only fifty yards, when it plunges with a terrific roar over the rapids and falls into the narrow gorge below. This report leaves the Yosemite Falls ahead for height and Niagara Falls ahead for sublimity.



ORIGIN OF MENUS.—The use of the menu dates back to 1489. According to a German gastronomical publication, the Elector Henry of Braunschweig attracted general notice at a State dinner in Regensburg by referring to a long paper before him every time he ordered a dish. The English Earl of Montfort sat near, and asked the Elector what he was reading. The Elector passed the paper to his questioner, and it proved to be a list of the viands prepared for the occasion, which the cook had been induced to write out. The idea so pleased the company that each introduced it into his own household, and so the practice spread over the civilized world.

ADVERTISERS' WARNING.—Here is a point for advertisers. The manufacturers of a condiment of world-wide fame, who had been spending as much as $25,000 a year on advertisements with one London agency, suddenly decided that, as their product was on every table, this outlay might be saved. All orders and contracts were accordingly stopped; but with what result? Trade declined so quickly that to recover lost ground the firm are now spending twice $25,000 a year. It is a fact that wholesale houses reduce their orders to manufacturers when they find the latter diminishing their advertisements, because experience teaches them that the public demand for an article falls off as the advertisements disappear.—*London Caterer.*

SOUND ADVICE.—Every young man to have a home must have a wife. He can never substitute a boarding-place, a club, or hotel for a home. This is to go through life hanging upon the skirts of life, leading a joyless, selfish, unnatural, and unpatriotic existence. God putteth the solitary in families. It is the best provision He can make for their usefulness and welfare. This divine arrangement cannot be set aside, or improved upon, or written down as a "failure." Young men and women are still to marry, build homes, rear families, plant gardens, and eat the fruit of them, marry when young, even though poor, join hands and hearts, and climb the hill together; they will reach the summit all the more surely and quickly.—*New England Magazine* for November.

PRODUCTIVE WELL.—The drillers engaged in sinking a well for the Natatorium at Fort Worth, Tex., struck a flow of water which excels that of any artesian well known. The flow is 600 gallons per minute and is as clear as crystal. The well is 1,052 feet deep, with a 10-inch bore at the top, tapering to five inches at the bottom. Fort Worth can boast of the largest flowing well in existence. the largest hitherto known being at Bourne, Lincolnshire, England, which discharges 500,000 gallons daily. At Aire, in the province of Artois, France, from which province is derived the name of artesian wells, there is a well from which the water has continued to flow for more than a century, and at the old Carthusian convent at Lillers, there is another which dates from the twelfth century.

Is a spoonful a spoon

heaping full

or

rounding full?

One rounded teaspoonful of Cleveland's Baking Powder does as much work as a heaping teaspoonful of others; quite a saving on a year's bakings.

Cleveland's leavens *most* and leavens best. Try it.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. PURE PEPSIN

In Powder and Scale.

MANUFACTURED BY

ARMOUR & COMPANY, Chicago.

Guaranteed free from adulteration or make-weights: of excellent physical properties and high digestive power.

Under similar conditions, **ARMOUR'S PEPSIN** will exhibit greater activity than any other pepsin now before the profession.

The Manufacturers will be pleased to supply members of the Medical Profession with samples of their pepsin, and with full details regarding digestive strength, if desired.

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

(ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

ARROWHEAD HOT SPRINGS,

CALIFORNIA.

I MOST respectfully invite physicians of the East to write to me for information concerning this famous Southern California resort. The hot mineral water mud baths, and climate are unequalled in America. Diseases of the throat, lungs, liver, stomach and kidneys, nervous and skin troubles and rheumatism, are the ailments successfully treated. The hotel contains 125 rooms, is first-class, and lighted throughout with incandescent lights. Elevation 2,000 feet. Address,

H. C. ROYER, M. D.,

Arrowhead Springs, San Bernardino Co., California.

GOITRE, or THICK NECK.

I have a positive, speedy, cleanly, harmless and almost inexpensive cure. Come or write to me at 28 Arlington Court, CLEVELAND, Ohio. It is no iodine smear. Cure made permanent.

Dr. J. CASKEY.

RHEUMATISM AND NEURALGIA

are being constantly cured by Robinson's "Sura Cura," a positive antidote for all impure states of the blood. Price, $1.00, sent by mail. Send for circular.

ARTIFICIAL ALMONDS.

We read in the Washington *Star* that "there are many factories in the United States, particularly in Connecticut, which are engaged in the production of adulterants for sale to various trades, such as ground cocoanut shells for mixing with pepper. It is estimated that there is hardly any pepper on the market at present which is not at least three-fourths something else. The manufacture of such articles intended for the express purpose of swindling consumers, often to the injury of their health, is unrestrained by any legal enactment. In fact, the sophistication of foods has come to be regarded as a part of legitimate business." Statements of that kind do harm rather than benefit to the cause of food purity. A half truth is usually more injurious than a full falsehood. The anti-adulteration effort has enough to contend against without being further handicapped by the necessity of combatting and refuting exaggerated statements made by its would-be supporters. That ground cocoanut shells are often mixed with pepper is an unfortunate fact, but that three-fourths of the pepper in our markets is counterfeit is equally untrue, as likewise is the statement that the manufacture of swindling food frauds is winked at by our law makers. Every reader of the AMERICAN ANALYST knows the fallaciousness of stories of this sort, but only those actually engaged in ferreting out the frauds referred to can appreciate the harm done by such misleading, reckless statements. But a constant supervision is kept over food products in this country, and when, probably, in the near future, wise Congressional legislation is brought to bear on it, the evil will be largely mitigated. Its entire suppression will not be effected while manufacturers and shopkeepers are actuated by covetous greed—nor while the careful housekeeper, solicitous on behalf of limited income, seeks cheapness in her household provision instead of wholesome quality. We learn from Washington that a report, which our correspondent states will be of "a rather startling nature," is about to be issued by the Department of Agriculture on the adulteration of coffee and tea. The former appears now to be chiefly sophisticated by the substitution for the real beans of artificial ones moulded from compositions made of clay, condensed milk and other materials. Secretary Rusk will urge the importance of excluding these and other imitations from importation to this country by the passage of a law shutting out articles palpably intended for the falsification of food. The beans are manufactured by wholesale in Germany and sold here for ten cents a pound. From Utrecht, also, are now coming large quantities of artificial almonds, made from glucose paste. They are shaped and colored by machines, being finally steeped in nitro-benzole to give the necessary odor. The deception is so perfect that, when mixed with the real article, the counterfeits are scarcely to be discovered.

VANISHING COINS.

The old-time problem regarding "what becomes of the pins" has never been satisfactorily settled, for the tentative response that they fall to the ground and become terrapins was long ago, and very properly, repudiated by what is known as good society, as frivolous and empty verbalism. A newer and more significant problem has come to the front—what becomes of the pennies? This is a question that strikes home to the bosom of every householder and father of a family. A century ago Franklin called attention to the circumstance that the accumulation of wealth, computable in pounds sterling, was greatly accelerated by close guardianship of the elusive penny—a forehanded theory that if he were yet living he would doubtless cite to explain the handsome accumulations popularly credited to several of our wealthy citizens, such as the Astors, the Rockafellers, Vanderbilts, Flowers, Carnegies, and others that might be named. There is no doubt those examples would have been exhibited by Poor Richard as illustrations of his famous maxim, though in our own minds the fortunes referred to were due to several other causes besides the hoarding of small currency. Accordingly, the problem as to the ultimate destiny of the penny is still an open question. Its magnitude may be summarized from the fact that the Philadelphia Mint last year alone coined ninety-four million pennies, and yet the requirement for that smallest of pecuniary conveniences is so great that the manufacture goes on unceasingly. We understand that bronze cents are subject to more accidents than happen to any other United States coins. It is said that a penny changes hands in trade ten times for once that a dime passes from one pocket to another. Being of small value, these little pieces are not taken much care of. There are a thousand ways in which they get out of circulation, and thus the minting of them has to be kept up continually. The metal blanks from which they are made by the simple process of stamping are turned out by contract for Uncle Sam by a factory in Connecticut at the rate of a thousand for $1. As they come from the machines, fresh and new, they look like glittering gold. One may get a notion of the number of pennies lost from the history of the old half-cents. Of these 800,000 were issued a few years ago. Where are they now? A few are in the cabinets of coin collectors. None have been returned to the mint for recoinage, or are held by the Treasury. Nobody sees them in circulation. All of them, except some hundreds saved out by curio hunters, have absolutely disappeared. Of the old copper pennies 119,000,000 still remain unaccounted for, save that once in a long while one sees a specimen. There are more than three million bronze two-cent pieces somewhere, out of 4,500,000 of them that the Government issued. Of nickel three-cent pieces nearly two million are yet outstanding, although it is very seldom that one of them is met with. What becomes of these pieces?

DRINKS AND FAME.

If Dibden, who declared that he would not care who made the laws provided he could write the songs of his country, had lived in this generation he might have been impelled to substitute the invention of new beverages in the place of writing new ballads. The discoverer of a "drink" stands a good chance of being immortalized by the association, as is shown by the number of men's matutinal mixtures that are specifically known and periodically called for by the names of their ingenious inventors. Sometimes it occurs, however, that the appellation is bestowed in return for unconscious connivance rather than in token of original discovery, as in the case of the all prevailing American appetizer and "eye-opener," the cocktail. The peculiar title of this famous delicacy appears to be of Mexican origin—somewhat corrupted in the process of adaptation. According to a writer in the *Hotel Mail* the Aztec word

READ PAGE 549.

for pulque, a somewhat alcoholic beverage made from the juice of the maguey or agave, and very popular in Mexico, is pronounced very much like "ocktail," and accordingly General Scott's troops called the liquor cocktail, and carried the word back to the United States. It is said that the liquor was discovered by a Toltec noble, and that he sent it to the king by the hand of his daughter, Miss Xochitl, whom the soldiers misnamed "cocktail." The king drank the liquor and then looked at the maiden. The first tickled his palate, and the second enamored his heart. It was a case of love at first sight in both instances, and he married the girl and started a pulque plantation. From that day to this the Mexicans have kept themselves saturated with pulque, and Miss Cocktail is one of the Venuses of Mexican tradition.

EUROPEAN SALADS.

HOW THEY UTILIZE VEGETABLES ON THE OTHER SIDE OF THE ATLANTIC.

A correspondent of the London *Caterer's Journal* writing of cooked vegetable salads, says: These are very much more popular on the Continent than I find them in Britain, yet in ten years it is wonderful how the intercourse of nations and the "running to and fro upon the face of the earth" has dispelled the old British prejudice that cold vegetables were only good to fry up in grease, or give to the cat or dog, the pigs, or any other similar English domestic or farmyard pets. Almost any vegetable can be turned into a salad. When cooked, one of the most popular is beetroot salad.

BEETROOT SALAD (1).—Red beets are much better baked than either steamed or boiled. The color is more fully preserved by the former process, as well as the natural juices which render the beet a valuable article of nutritive diet. Peel and slice the beetroots after they have become cold. The rings should be thin, and, if very large, cut into halves; lay them on a dish with half rings of Spanish onions between, sprinkle with salt, dust pepper over them; add two tablespoonfuls of vinegar to each half pound of beetroot. A drop or two of chilli vinegar improves it.

BEETROOT SALAD (2).—Cook the beets, and when cold cut into small dice; place in a salad bowl with half the quantity of truffles or morsels also cut up; a small eschalot finely minced, and strew in amongst the beetroot, etc.; this takes off the earthy taste. Sprinkle one teaspoonful of salt to each half pound of salad mixture, and half the quantity of white pepper; rub the yolk of a hard-boiled egg through a sieve, mix into it half a tablespoon of oil or cream, add vinegar to lemon juice (about two tablespoonfuls) and a teaspoonful of mushroom ketchup; pour over the salad, garnish round with cress, endive, or the tender leaves from celery if nothing else can he had. By the way, celery leaves make a very pretty garnish, and it is a wonder they are not more used.

GERMAN BEETROOT SALAD.—Bake a small red and boil a large white beetroot. We will presume the weight of the red to be half a pound, the white one pound. Boil two eggs hard, mince them up. When the roots are cold, peel and cut them into slices one-eighth of an inch thick, and again into strips. Slice a strong onion, and mix with them. Lay the white beet in the bottom of the salad bowl, and the slices of onion over; cover with vinegar, add salt and sugar (about one teaspoonful of each), let them lie for two hours. Remove the onion, lay on the eggs, shelled and minced, on the top; arrange the red beetroot together with slices of lemon, and a couple of tablespoonfuls of finely minced parsley. N. B.—The parsley should be put into a cloth and wrung dry after it has been chopped as finely as possible.

POTATO SALAD.—In France and on the Continent a small potato, close and watery to English ideas, is used for salad making. They are boiled, and whilst hot, dressed with oil, vinegar and pepper. When cold they are arranged on the dish and garnished with minced eschalot, or a centre of onions "sweated" down in butter, *i. e.*, the bulbs are put into a small stewpan, say, twenty little button (silver) onions peeled, with two ounces of cooking butter, the lid is put on, and the pan placed over a gentle fire, where they cook in the steam they generate and the butter. They are shaken from time to time, and when done are lifted out of the pan, drained from the butter (which is used for the white *roux*), and when cold served with the cold potatoes as a centre, the sliced potatoes laid round, and ring of pickled red cabbage or beet forming an outer circle. A garnish of minced parsley, which is generally scalded first and then wrung dry, is scattered over the potatoes.

ENGLISH POTATO SALAD (1).—Cut half a pound of cold potatoes into slices and intermix them with green garden salad stuffs, such as lettuce, cress or endive. Dress this with vinegar, mixed in the proportion of two tablespoonfuls of vinegar to half a teaspoonful of ready-made mustard, the same quantity of salt, one teaspoonful of sugar, and pepper to taste; or, instead of pepper, a teaspoonful of some popular sauce of the Worcester type.

POTATO SALAD (2).—Slice cold potatoes, add a sliced mild Spanish onion, also pickled French beans, cucumber pickles, and a couple of mellow pickled walnuts, all cut up. Pour over this a dressing of oil and vinegar, seasoned with pepper and salt. I have only one fault to find with the majority of the English potato salad makers, *i. e*, they dress the potatoes with oil and vinegar after they have become quite cold, instead of slicing them and adding the condiments when they are yet warm. This simple reversing of the order of dressing makes all the difference in the taste of the dish, and renders it at least digestible, as the oil is a splendid digester of vegetable fibrine and the vinegar a softener; besides, whilst hot, the cellular tissue of which the vegetable is composed is more open, and the oil penetrates into the food, and is not so perceptible to the eye; has not the greasy look, but gives a wonderful softness and *gout* to the food.

HARICOT BEAN SALAD.—Put the beans into cold water, wash and pick them, removing light and worm-eaten seeds. The large beens are uaually preferred for salads. Drain them and put into a pan with boiling water and salt; cook them till tender, shake them from time to time, but avoid stirring with a metal spoon, as it causes the bean skins to shrivel; the water should be well salted, or they can be baked in an earthen ware jar and meat stock—the liquor in which beef, mutton, or poultry has been cooked will do. An onion put in with them improves the *gout*. When quite tender drain them; pour over oil and vinegar in the proportion of two tablespoonfuls of olive oil to one of vinegar, with salt and pepper to taste, Mince one tablespoonful of parsley for each half pound of beans and one eschalot; sprinkle over the beans, and mix up altogether whilst they are warm. Pile on a dish, and when cold garnish with watercress, parsley, or any light green decoration.

TORNADOES.

AN OFFICIAL OF THE U. S. WEATHER BUREAU EXPLAINS THEIR CAUSES.

None of the more powerful manifestations of nature have been more carefully studied than the tornado; yet many of the theories are undergoing very significant modifications. We shall not discuss these theories; but consider the environment of the tornado, its work of destruction, and the other facts that have been determined. One should distinguish between the cyclone and the tornado. The term "cyclone," representing to the scientific mind, a broad storm and of relatively slight violence should give way to the proper term "tornado." This is a very violent electric storm, of limited extent, having an indescribable roar and often a funnel-shaped cloud. On a quiet but very hot afternoon there suddenly appears in the southwest horizon an ominous greenish-black cloud; the sky is almost cloudless overhead and there is a gentle south wind blowing toward the general storm, which almost invariably will be found to the northwest and about four hundred miles away. Occasionally light, fleecy cirrus clouds, generally from the south, pass high overhead. Suddenly the black cloud draws near, preceded by a tremendous mass of dust, and a terrible roar, likened to "the bellowing of a million mad bulls," or to "the passage of ten thousand trains of cars through a tunnel," is heard. This characteristic roar is usually heard at least fifteen minutes before the arrival of the tornado, and in conjunction with other signs gives ample warning of its approach. The cause of this roar is not easy to determine. It is like a continuous roar of thunder, and is, without doubt, some manifestation of electricity, and it has been heard in a violent thunder storm. The wind now blows hard from a western point, but it is hardly proper to say that it shifts to the west, as the cause of the west wind has no connection with that of the previous current from the south. Almost immediately the tornado, often ushered in by a fearful pelting of hail, is upon us. On the south side the destruction often extends a thousand feet or more, while on the north side one may safely stand within four hundred or five hundred feet of the greatest destruction. The velocity of the tornado is nearly double that of the general storm, which shows that its movement is not due to the onward progress of the upper current. Moreover, we have just said that the upper current is from the south, while the tornado advances from some western point. The cause of this enormous increase in velocity is not easy to determine. A tornado has been aptly called the extreme development of a thunder storm. If this view could be firmly established, it would be an important guide for future observations, for the latter storm can be readily studied. In a thunder storm we find that the pressure almost invariably rises; that as to winds there is a down rush in the centre and an out rush on all sides; and we also find frequent heavy hail falls. This storm, like the tornado, appears to have its own source of energy, its velocity is double that of the general storm, and it is situated about four hundred miles to the northwest. That there is a most violent down rush in many tornadoes has been abundantly proved by the crushing of houses, by the breaking of limbs of a tree and causing them to fall at its base, and many other signs. Examination of the region of tornado activity shows the existence of a large number of paths of individual tornadoes. These paths are parallel, and occur farther eastward as night draws on. The earliest occurs about 3 o'clock p. m., and the latest even as late as midnight. These independent tornadoes, so long after sunset, seem to show that the sun's direct heat has little or nothing to do in causing them. The fact that fowls are entirely denuded and left alive, and that houses sometimes present the appearance of having been exploded, are advanced as proof of the existence of a vacuum in a tornado. But these phenomena often occur at some distance from the tornado centre, while the partial vacuum, if there were one, would not extend so far. The existence of the assumed whirling motion in the tornado has not been proved; and the evidence found in the distribution of *débris* is against it. Universal belief prevails that there is powerful suction toward the funnel cloud, and upward rush in the centre; but on this supposition it is difficult to account for the fact that often a frail structure, like a chicken coop, is left intact, while near by a strong house is dashed to pieces. The destructiveness of tornadoes has been very much overrated. From 1876 to 1884 the loss from tornadoes in the important States was only about one-fifteenth of that by fire. During the present year, up to September 2, it is reported that two hundred and five persons have been killed by lightning and ninety-five by tornadoes.—*Prof. Hazen, in Engineering Magazine.*

FREE LUNCH.

HOW THE SALOONS OF NEW YORK ARE PROVIDED.

AN EXTENSIVE INDUSTRY WITH WHICH FEW ARE ACQUAINTED.

A reporter of the AMERICAN ANALYST passing recently through one of the thoroughfares on the extreme western edge of the up-town business section of the city had his attention attracted by the unloading of a wagon in front of a liquor saloon. A steady procession of wagons and carts was moving in both directions, and the contiguous supply of liquor saloons was only limited by the number of aldermanic aspirants who had selected that locality as a foothold for their ambitious purposes. There was nothing phenomenal, therefore, in the mere circumstance of a vehicle disgorging its contents into a saloon, but the character of the merchandise thus transferred was what excited the reporter's curiosity. The wagon was a boxed-up affair, similar in shape to the express wagons in which our city mails are transported. Folding-doors opening at the rear displayed to view an ingenious system of boxes containing sliding trays, and these latter, as they were carefully carried into the house, were seen to be filled with a variety of toothsome eatables. One in particular bore a mammoth oval platter, on which, on a snowy napkin, a magnificent salmon, adorned with flowers, was stretched at full length in naked glory, like a nymph reposing after her bath. Others contained dishes of tempting croquettes, boned turkey, patties, salads, crisp and cool, and sandwiches enough, apparently, to supply several barge-loads of famished Fresh Air excursionists. Sardines, olives, shrimps, and a variety of condiments, on appropriate dishes, were interspersed among the more substantial viands. Our reporter, using his professional privilege, entered the establishment and was jovially welcomed in a spick and span newly equipped bar-room by the proprietor, who, bareheaded and in his shirt-sleeves, was disposing the dishes as they were brought in upon a table running across the room. It was the opening day of a new saloon, and the tempting feast that was being laid was a "free lunch" for the benefit of the public. In the short conversation that ensued, the reporter, who, of course, was a teetotaller, and wholly unused to the ways of metropolitan bar-rooms, learned to his amazement that the very handsome layout was probably only a sample of many hundreds that had been provided that day by an establishment which makes a special business of furnishing free lunches for bar-room entertainment; and that apart from the linen and china, and a few other accessories of this special occasion, the repast before him comprised only a small portion of the daily product served to saloons throughout the city. The free lunch is essentially an American institution, like the bar-room to which it pertains. Its only transatlantic prototype at the present writing is, we believe, to be found in the taproom of the Mariners' Hotel in Liverpool, where, since May of the present year, a free-to-all spread has been provided by the proprietress, Miss E. Joyce, from 11 to 1 daily. In this country it is an almost universal adjunct of the bar-room business, and in several cities, notably San Francisco and New Orleans, the gratuitous lunch that is daily set forth to attract drinking customers constitutes a repast that in elegance of preparation and variety of viands would do credit to the dining-room of the wealthiest citizen. In New York the free lunch system, if conducted on a less elaborate scale, is equally generous in its provision for the hungry multitude. If you step into any bar-room on Manhattan Island during the noontide interval of rest from work, you will find a layout of eatables of some sort, from the never failing brown bread, salted pretzel, and dried herring of the beer saloon to the soups, fish, cold meats, sandwichse and salads which an attentive waiter stands ready to dish out for you in liberal portions in the brilliantly appointed *cafes* that decorate the more fashionable and the commercial sections of the city. A very extensive business has grown up for furnishing public houses with these free luncheons. How extensive that is may be fairly conjectured from the fact that, excluding from the computation the 3,000 German beer shops where, as already stated, the desire for the foaming tonic—no longer entirely Teutonic—is stimulated by brown bread, sour, and seasoned with cardamum seeds, and by chunks of dried salt herring, there are fully 7,000 bar-rooms in New York, almost every one of which provides its customers with a free lunch daily. Excepting a few establishments connected with hotels of the higher grade, where meals are served in restaurants "on the European plan," the surplus of which graces the bar-room on the following day, these lunches are all prepared by outside caterers, who supply their patrons daily. There are about twenty concerns of this kind in the city, a few of which find it necessary to use a horse and wagon to make their daily deliveries—the majority, however, sending their dishes to their customers in covered trays carried by hand. The largest free lunch purveyor in the city is the one which supplied the "opening" entertainment mentioned at the beginning of this article. It is the Knickerbocker Catering Company, an incorporated Company, of which William Fowler, Jr., is President; John L. Adams, Vice-President; and Captain William Fowler, Secretary. The latter is widely known as the former genial proprietor of the Knickerbocker Cottage, in Sixth Avenue, and to-day as the Grand Panjandrum, "little top button" and all, of more social and convivial organizations in this city than any other living man ever was affiliated with at one time. The Knickerbocker Company is an institution that deserves and well repays inspection. It began business a few years ago on a small scale, in John Street, extending gradually into larger quarters successively in West Street and Carmine Street, until in the early summer of the present year its growth necessitated the renting of the commodious quarters it now occupies at 626 Washington Street, where a four story and basement building is wholly appropriated to its use. On the ground floor are two entrances from the street, one disclosing a handsomely appointed office, the other serving as a wagon way, into which the delivery wagons are backed to receive their daily loads. The rear apartment is a large and airy kitchen, where Mr. John L. Adams, Superintendent of the *chefs*, directs his force of assistants. Three huge ovens serve for baking everything excepting bread, that commodity being furnished exclusively by the regular bakeries. In a monster cauldron, large enough to serve the purposes of an army corps, beans are boiled by the barrelful, while in another vast pot potatoes are boiled on a similar wholesale scale. When the various articles are cooked they are apportioned out in neat vessels, pans, and dishes, and are placed in compartments, each kind by itself, on shelves which line the sides of the large apartment in front of the kitchen. Here daily, in the early morning, they are loaded into the wagons for distribution among over a thousand saloons. On the second floor is, in one corner, a vast ice-house and cooling room, the rest of the apartment being appropriated to sinks and troughs, where the returned dishes are washed, and pans are scoured by a number of female employes, who likewise pare the potatoes, pick the meat from the shells and claws of lobsters, and otherwise prepare the various viands for the kitchen. The third and fourth floors are utilized for storage purposes, excepting an apartment on the latter story, which serves as a dining-room for the manager and his clerks, the meals being sent up from the kitchen in a dumb waiter. Everything in the building is neat and orderly to the senses, and eatables and utensils alike are handled with the solicitude that one fondly trusts characterizes the culinary processes in his own domestic establishment.

The extent of the free lunch system in New York can in some degree be estimated from the variety of comestibles provided by this one catering company. These comprise, daily, clam chowder, clam, vegetable, and tomato soup, beef pie, veal potpie, boiled ham, baked beans, served in eight different styles, besides the toothsome Boston method, boned turkey, macaroni, bean, potato, salmon, chicken and lobster salads, fried oysters, corned beef in glorious rounds or hashed, roast beef and turkeys, boiled pig's head, baked livers, liver and bacon, sweetbreads and calves' brains, soft crabs in season, fried eels, and, on Fridays particularly, fish in variety of kinds and diversity of styles. Add to these cooked meats a great assortment of condiments and "fixings"—olives, sliced beets, pickled tripe and pigs' feet, mixed pickles, etc.—and it will be conceded that the gratuitous appeasing of the noontide appetites of the thirsty but impecunious New Yorker is an enterprise of extensive proportions. Ten wagons are required to make the daily deliveries of the Knickerbocker Company. Each driver, having received and reported to the manager on the previous day the orders of his several customers, backs in his wagon to the distributing counter in rear of the office, where, by skillful system, his already selected load is speedily shipped and checked off on the shipping clerk's blotter. The ordinary dishes are set in trays that, fitting together, are piled on one another—about fifty trays constituting a wagon load. The fish and specially prepared dishes are sent out in crates with hinged lids, inside of which the platters are firmly held by cleats. About 6 o'clock each morning, excepting Sundays, these wagons set out on their tours of distribution, and towards noon they are back again, when the drivers make returns of the day's transactions, give in their books containing the orders for the following day, and turn over the cash received for what they had just been delivering. For this is a strictly cash business—each day's order being paid for on its delivery. The 7,000 New York saloons that provide free lunches to their patrons must pay out a goodly sum of money daily to these purveyors; but as the cost of the food is more than offset by the increased trade it attracts, the expenditure does not, as one might at first imagine, react upon their customers as a tax upon drinks, to be levied by an increased dilution with Croton water. Some idea of the cost may be gained from the orders filled by one of the ten wagons on the day our reporter visited the establishement. These, representing, of course, a number of saloons, comprised 12 gallons of clam chowder, 4 of clam soup, 1 of tomato soup, 1 boiled ham, 46 pans baked beans, 25 crocks Boston baked beans, 2 crocks macaroni, 5 dishes bean salad, 20 of potato salad, 16 of salmon salad, and 1 of lobster salad, 1 gallon sliced beets, 4 pigs' heads, 40 lbs. corned beef, one plate corned beef hash, 13 platters of fish and 6 of fish hash, 200 fish balls, 72 fish cakes, 2 rounds roast beef, 16 lbs. larded liver. The entire delivery of that wagon on that Friday amounted to $70.55 in value. There are some single saloons whose daily expenditure for free lunch foots up to more than half that amount. A well known establishment on Park Row, above the bridge, consumes each day an average of 200 loaves of bread, 150 lbs. sausage, 30 lbs. corned beef, 20 lbs. roast beef, 50 lbs. Frankfort sausages, besides a variety of smaller items, at an aggregate expense of upwards of $40 for every noontide repast. The average cost, however, to well patronized saloons in business thoroughfares, where every other passer-by is not in search or in need of a free meal, may be put at from $6 to $12 per day. It is accordingly within reasonable limits to estimate the daily expenditure in New York for free lunches at $50,000; a statement that will at first stagger the reader's belief, but one that will, as the above figures indicate, challenge acceptance on investigation. Extend the computation to cover all the cities in the country, and the free lunch business will be found to represent an enormous annual expenditure.

BRIGHT STORIES.

AN ARTIFICIAL MIRAGE.

ROBERT DUNCAN MILNE, IN "THE ARGONAUT."

(*Concluded from page* 532.)

"For a year previous to my coming here I had been staying in the Owens River Valley, prosecuting some scientific researches, into the details of which I need not enter here, and having concluded them, decided upon taking the Southern route, so as to strike the Atlantic and Pacific Railroad at some point on the desert. I accordingly started out one morning last March on my hundred-mile trip, with a light wagon and a span of mules, taking with me my instruments and the more valuable articles of my household furniture, and sending the rest to the city by the more roundabout Carson and Colorado route. Among other articles I took with me, for safe packing, was a large and very handsome mirror, which had been one of the few adornments of my country home, and which just filled the bed of the wagon.

"I stopped the first night at Coyote Holes, and the second at Desert Springs, near the mouth of Jawbone Canon, the latter being the last station on the old team road from Los Angeles to Independence, before entering on what is known as the forty mile desert. This forty-mile stretch of level sand must be passed over between dawn and nightfall, as there is no intermediate water on the way.

"The day was a hot one for the middle of March, and towards noon, as I had then gone more than half way, I thought it time to feed and water my team and rest for an hour or two till the heat had somewhat subsided. My spirit-lamp had got mislaid, and, before I found it, I had to remove a good many articles from the wagon, among them the mirror I spoke about. This I stood on end, and for the time being, with its back resting against the seat of the wagon, and proceeded to prepare some coffee in such shade as the wagon afforded from the midday sun. My matches I always carried in the jockey-box, and had to climb to the dash-board to get them. As I did so, I happened to glance over the top of the mirror, and the scene which then met my gaze was one that at once riveted my attention and transfixed me with astonishment. There, directly in front of me, and seemingly not more than a mile away, was depicted a scene which I at once recognized as a fac-simile of the town of Santa Barbara, as seen from the hills that rise above it on the east. In the foreground was the old mission, with its many-arched facade gleaming white against the background of fields and orchards below; beyond that again the town, the streets, the Arlington Hotel, and, last of all, the wharf and the ocean, its sapphire waves dancing and twinkling in the summer sun.

"So entranced was I by the scene, every feature of which was familiar to me, that it was several moments before my reasoning faculty resumed its sway. I knew that I was gazing on a mirage—as perfect and vivid a one as I had ever seen upon the Nubian Desert—and then I found myself speculating upon causes. I jumped to the ground beside the wagon—the scene was still there. I walked ten paces to the right—it was gone; the same distance to the left—it had disappeared. The heated air shimmered above the sand in every direction over the level expanse of desert. All the conditions of mirage seemed to be present, and yet nothing was visible except in the neighborhood of the wagon.

"I again climbed to the seat and stood looking over the top of the mirror. There was Santa Barbara, as distinct and vivid as before. 'Could the mirror,' I asked myself, 'possibly have anything to do with the production of the mirage?' I took out a pocket compass, which I always carry, and found that the needle pointed nearly due south-west. Reference to a pocket map of the State showed me that Santa Barbara lay in exactly that direction from my present position on the Mojave Desert, and that the needle stood in line with the bed of the wagon, and, consequently, at right angles to the plane of the mirror. This could scarcely be an accidental coincidence. Could it be possible that the mirror was directly instrumental in projecting the spectrum of the scene before me? But why that particular scene and no other? why not a more contiguous or more remote point equally as well? A thought struck me. Gently and very slowly I pushed the top of the mirror forward about an inch, so that the plane of its longer axis, which, owing to its leaning position against the back of the seat, was originally some forty degrees out of the perpendicular, approached a little thereto. At once the picture vanished, and was replaced by a level expanse of blue water, an occasional white-sailed ship flashing across the scene. Another inch forward and I caught a glimpse of a tropic island, such as are common in the South Pacific. It passed from the field of vision so quickly that it was only with extreme care, and by moving the mirror backward and forward by minute fractions of an inch, that I again caught it, so that it stood before me in all the splendor of its tropical verdure and the calm of its sapphire sea. Further forward motion brought a sandy desert upon the landscape, in character like those of Central Australia, and a still further approach to the perpendicular brought snow and desolate ice-floes into view. I should never have tired of the endless and varying panorama had not the sun's declination warned me that I must be moving if I hoped to make Willow Springs that night.

"Had not business compelled my presence in San Francisco, I would have pursued my investigations still farther on the desert. I had seen enough, however, to convince me that the phenomenon which we term the mirage is not accidental in character, but is dependent upon immutable physical laws, and that the reason is not invariably apparent, in some shape or other, upon every plane surface, desert or ocean which radiates heated air, is that the extent of the visual angle formed between the spectral scene and the eye of the beholder is a matter of such extreme nicety that, unless the image is projected exactly in the plane of the eye of the beholder, it falls either above or below such plane, and accordingly does not fall within the field of vision. The occasions are rare upon which this happens naturally, and it is only by employing a plane mirror to deflect the light rays, which fall upon it from distant objects, in an absolutely horizontal direction, that one can control at will the subject of a mirage.

"And this brings me to the discussion of another characteristic of the laws governing the transmission of light, which is wholly at variance with present scientific theory, but is really in consonance with the known laws of optics. How is it possible that every scene, pictured by the mirage, always appears at exactly the same distance, no matter whether the real scene is a hundred, a thousand, or ten thousand miles away? Why, for instance, did the tropic island in the Pacific, which I have described, seem as near as Santa Barbara did, though the latter was about one hundred, while the former was probably three thousand, miles away? And yet this seeming paradox is susceptible of a very simple explanation.

"Light, as every school boy knows, radiates from every object equally in every direction, and each ray travels in a straight line, so long as the medium through which it travels is homogeneous in character. It is manifestly impossible that the light rays, emanating from an island in the South Pacific, could reach California if they proceeded in a straight line, as the curvature of the earth would forbid it. Consequently they must travel in a series of obtuse angles or in a curvilinear course. We know that the simpler forms of mirage are due to the fact that a natural mirror is formed at the plane of junction between two strata of air of differing densities. We know, also, that the air or atmosphere which surrounds the earth moves with it and is as much a part of it as the water of its oceans. There must, then, clearly be a dividing line, a plane of junction, between the atmosphere and the ether, or ethereal medium, which is supposed to pervade space beyond. The atmosphere has been variously supposed to stretch from forty to two hundred miles out from the surface of the earth—investigation has shown me that the latter figure is nearer than the former, the exact height being easily deducible from the angle made by the mirage mirror and the distance of the object, the image of which is projected in the mirage.

"Now, natural laws are invariable, and analogy demonstrates that a natural concave reflector of small curvature and immense radius must be formed at the plane of junction between the atmosphere and the ether—so slight is the curvature at any particular point that such a reflector may be said to be composed of a series of plane mirrors. It is a law of optics that the angle of reflection is equal to the angle of incidence. It is, also, a law of optics that rays of light are refracted in their passage through media of varying density. We know that the atmosphere becomes rarer and rarer in proportion to its distance from the surface of the earth. Accordingly, light rays proceeding from earthly objects become more and more curved in their outward course through the gradually varified atmosphere, till they strike the gigantic atmospheric reflector formed at the point where ether and atmosphere meet. The direction which light rays, entering a rarer from a denser medium, take, is ever a deviation from the perpendicular; accordingly, the direction taken by the light rays from Santa Barbara and those from the tropic island were sections of a circle or a parabola till they struck the atmospheric reflector, from which they were again deflected inward in a course the exact counterpart of their outward movement. While my mirror was reflecting the rays from Santa Barbara, it was, at the same time, reflecting the rays from the tropic island, and from every section of one hemisphere of the earth's surface in the same plane and on the same great circle; but only the rays from Santa Barbara were reflected in an exactly horizontal direction, as was necessary in order to bring them within the field of vision; the *simulacra*, or mirages, of all other scenes were projected either too high into the air or too low into the earth, and could only be projected into the visual field by raising or depressing the mirror, so that an angle drawn horizontally from the plane of the mirror would be the exact counterpart of the angle at which the rays from the ethereal reflector impigned upon it, these again emanating from a point on the earth's surface just as remote upon the other side. I trust I am making myself intelligible and not using expressions tending rather to obscure than elucidate the very simple principle involved.

"The reason for the projection of the image of a distant object, at apparently the same distance from the beholder, can only, I think, be explained on the hypothesis of the emissional or corpuscular character of light; the ascending rays being, by passing through a series of rarer and rarer air strata, immeasurably refracted and diffused at the point of impact with the ethereal reflector, and in exactly the same ratio concentrated and gathered during their downward course, so that the image looked at is the exact counterpart of the original, and the sense of distance is practically lost. Further investigation will certainly demonstrate the exact nature of the optical law involved in this apparent paradox.

"And now, gentlemen, I have explained as well as I am able the nature of my chance discovery, and you have seen the preparations I am making to produce in a mechanical and positive manner that phenomenon which is now seen only accidently upon heat-radiating seas or deserts. I calculated, by a very simple

measurement of the visual angle from three points about my wagon, that the spectral image projected from my mirror, which embraced about two miles in breadth of vista, and the distance of the more vivid portions, of which was apparently about two miles from the beholder, was not really more than one hundred and fifty feet away, the effect of distance being due to the inability of the eye to frame impressions independently of those to which it is normally accustomed, the relation of size to distance being one of these. That is the reason for the dimensions of the area which I have taken such careful measures to have thoroughly and uniformly heated, to the same degree as thermometers indicate a few feet from the surface of the soil in a desert.

"Over there" (here the doctor pointed to three large piles of iron castings lying near) "are the sections of a circular track which will run round the periphery of the heated circle. Upon this will be wheeled a car, supporting a magnificent silvered mirror of plate glass, twelve feet by eight in measurement, manufactured expressly for me and for this purpose, so that the plane of the mirror can be directed to any point of the compass, and we can command a range from the North Pole to Equatorial Africa on the one hand, and from China to Central Europe on the other. You can imagine the splendid possibilities which underlie such an appliance as this. The mirror swings through an arc of nearly forty-five degrees, so that it will project an image or artificial mirage of scenes from one mile to twelve thousand miles away in any desired direction, its inclination from or toward the perpendicular being regulated by a micrometric rack-and-pinion motion of extreme delicacy, so that any spot, within the hemisphere of which that mirror is the centre, can be found with unerring precision by the simple use of the compass and micrometer, in the same way as an astronomer regulates his equatorial. The nearer the plane of the mirror is brought to the perpendicular, the further off will be the scene of which it projects the image upon the heated air in the centre of my circle; the nearer the plane of the mirror approaches an angle of forty-five degrees, the nearer will be the scene reproduced. A true angle of forty-five degrees will project a spectrum of the mirror and my grounds themselves, while a true perpendicular will project no image at all, the angle of reflection in such a case being coincident with the angle of incidence, and both running horizontally through air.

"And now, gentlemen, let me repeat my invitation for next Sunday. This is Wednesday. During the next three days I shall lay the circular track, mount my mirror on its car, and see that my heat-generators and pipes are in thorough working order. I will reserve my first trial to be made on Sunday with you, and I feel sure you will not disappoint me. I have now an urgent appointment I must keep, so I beg you will excuse me. Good-bye."

So saying, Dr. Wyman shook hands and turned in the direction of his residence, Harkness and myself walked silently to the entrance-gate with a feeling (at least in my case, and I think in his) that after all the mysteries of nature are just beginning to be unlocked, and more than ever appreciating the remark of one of the greatest physicists who ever lived, that with all his knowledge, in view of the infinite possibilities and mysteries which he saw on every side, he felt like a little child picking up grains of sand upon the shores of the ocean of eternity.

CURIOUS INVENTIONS.

SOME SINGULAR SUGGESTIONS OF INVENTIVE GENIUS.

The history and growth of inventions are subjects in which all are interested. The difficulties and rebuffs which inventors have had to undergo in the perfecting of their ideas, their perseverance and ultimate success, form most interesting reading. Vast sums of money are brought in by apparently simple inventions requiring no great mechanical knowledge. The accounts of these read more like the wildest fiction than simple fact, and are sufficient to make the least covetous among us yellow with jealousy. The stylographic pen brought in £40,000 a year; the india-rubber tips to pencils £20,000; metal plates for protecting the soles and heels of boots brought in £250,000 in all; the roller skate, £200,000. A clergyman realized £400 a week by the invention of a toy; another toy, the return ball (a wooden ball with a piece of elastic attached) brought in an annual income of £10,000; the "Dancing Jim Crow," £15,000 a year. The inventor of a copper cap for children's boots was able to leave his heirs £400,000; whilst Singer, of sewing machine fame, left at his death nearly £3,000,000. There are, however, other and wonderful things which people have thought it worth while to patent, strong in the hope of making a big fortune in the near future, only to find in so many cases that their inventions were impracticable, and very often perfectly ridiculous. Among such may be mentioned a child's bib with a trough attached, the whole formed of some waterproof material; a pocket which cannot be picked; a muff and boa filled with air to save you from a watery grave; cuffs and collars made of steel, painted or enamelled white; trousers with double legs—on the outer legs getting soiled or bespattered you tuck them up, and behold a clean pair. This arrangement would be suitable, I should say, only when worn with an overcoat. Under the head of umbrellas and walking-sticks we find some marvelous inventions. One is an umbrella which, in some wonderful way, is converted into a walking-stick, and so formed that a spear can be attached, when it is used as a weapon of offense and defense. I recommend it to elderly ladies in the dog-days, as a protection against the sun and mad dogs. The next invention is a rain-absorber, to prevent rain from running down from hats and umbrellas. The absorber is formed either of uncovered sponges or of sponges covered by a fabric. We are told that the absorber can be readily removed from the article, squeezed and replaced. We come next to an article which the inventor has named (take a long breath and shut your eyes) the "Rhabdoskidophorus." This is an umbrella which can be taken apart; the silk and ribs being hidden within the stick; it is thus transformed into a stout walking stick.—*Strand Magazine* (*London*).

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEATS.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUITS.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

FILET OF MACKEREL.—Carefully remove the filets of two large mackerel without taking off the skin. Pour some hot sweet oil and butter into the dish in which the fish are to be served, and lay the filets in it beside each other. Put them in the oven for half an hour, basting frequently; then take from the oven and pour tomato sauce over them after skimming off all the butter possible; strew fine dry bread-crumbs over them and bake slowly until brown.

BECHAMEL SAUCE.—Peel and slice very thin a dozen small white onions. Put them over the fire with a piece of lean ham, two or three spoonfuls of butter, and a few whole peppers. Cover the vessel holding them closely and steam gently until soft, but do not brown. Mix smooth in a little cream two tablespoonfuls of flour, then add a cup of clear broth. Add this to the onions and cook together, stirring all the while until the sauce is smooth and thick; then season with salt and strain it.

ROAST BEEF.—Take six or eight pounds of ribs of beef, and prepare a pan for roasting. Take a medium-sized onion, together with a good-sized tomato and a little suet; chop together very fine, so fine that they become a pulp, adding a little thyme, allspice, salt, pepper, and about a tablespoonful of vinegar. Mix all these ingredients together until the mass becomes quite smooth; then rub the beef thoroughly with this seasoning, leaving a part of it to mix with the gravy. When the meat is partly cooked put in the seasoning for the gravy, at the same time adding sufficient water to make the gravy. This seasoning will thicken it sufficiently, so that no flour is needed. Cook rare or well done, according to taste.

EGGLESS PLUM PUDDING.—One heaping cupful bread-crumbs, two cupfuls flour, one cupful chopped suet, one cupful milk, one cupful molasses, one cupful raisins and currants, one teaspoonful salt, one teaspoonful soda, one teaspoonful cloves, one teaspoonful cinnamon; bake two and a half hours.

FRIED ONIONS.—Slice your onions and let them soak in milk for ten or fifteen minutes; then dip each slice in flour, and then brown them quickly in very hot lard; drain them and lay them for a few moments on coarse brown paper to absorb the grease.

CELERY FRITTERS.—Cut some crisp stalks of celery into inch-long pieces, and boil them until tender in slightly salted water; drain them, then make a batter as follows: One teacupful milk, two well-beaten eggs, a little salt and a small teaspoonful of baking powder, one cupful of flour; add the celery to this and drop by spoonfuls into boiling fat, fry a light brown, drain on coarse brown paper, and serve with the meat.

ALMOND CAKES.—Whip the yolks of fourteen eggs until very light, and to them add half a pound finely chopped almonds and one pound powdered sugar, three-quarters pound butter, melted but not hot, and one pound flour. Beat until light, then add the whites of the eggs beaten to a froth, and bake in small greased and floured pans.

ANOTHER ESTIMATE.—Michelson has calculated the velocity of light to be 186,360 miles per second.

TOO HASTY.—It is said that the head porter at the Grand Pacific Hotel, Chicago, has retired with a fortune of $100,000, accumulated from the tips given him by the patrons of the house. It is a pity he had not waited for the World's Fair, for he might then have expected to double this fortune from English visitors.

FRESH BEER.—Aluminium is recommended by a well-known scientist of Vienna (Dr. Schultze) as a good material for preserving the freshness of beer, which deteriorates when kept a few minutes in a glass. The most effectual preservative, of course, is a silver vessel, but aluminium would be forty times cheaper than silver, and only half the weight of pewter.

ANCIENT VEGETATION.—In Galveston in sinking an artesian well which is now 2,040 feet in depth, gray and green clay mixed with wood, lime concretions, and pebbles were found at a depth of 1,510 feet. The age of the wood is estimated at 200,000 years by Prof. Singley, and in the stratum, which is one hundred feet in thickness, he found seeds resembling apple and hackberry seeds.

TRUFFLES.

HOW THAT GASTRONOMIC DELICACY IS RAISED IN FRANCE.

Gastronomers will be interested in a paper contributed by Horace G. Knowles, United States Consul at Bordeaux, to the coming issue of "Consular Reports," on the subject of "Truffles." The truffle, he sets out by explaining, is "a tuberculous fungus, a sort of morbid extravasation of vegetable sugars analogous to oak balls or nut galls, and doubtless originating, as these latter, by the sting of an insect." He quotes the naturalist Valserres, as saying that "during the months of July and August, a little fly, azure-winged and small of body, penetrates into the soil at the base of oak-trees or elsewhere in search of certain juices there to be found. With its sting it pierces some portion of the root, makes an incision, and therein lays its eggs. From this incision, or scar, there exudes a viscous substance, which, clinging to the root, grows into a truffle. How exact this theory may be," Mr. Knowles goes on, "is matter of conjecture. Certain it is that truffle-hunters are attracted to their spoil by a little insect; but it is not altogether impossible that the fly itself is attracted, like a true gourmet, by the very existence of the precious object. "There are three species of truffles found in France—the black and most common, the white (highly prized), and the *truffe a l'ail*, which has a flavor of garlic. They are found in all soils, but chiefly in oak forests or where the earth is damp and calcareous, thriving best in an almost sterile soil. The best that the country affords come from Perigueux and about Angouleme. In appearance the ordinary truffle is about the size of a walnut, with a rough brown, warty surface, closely akin to the potato, which it likewise resembles in consistency, though not in color. Not yielding to cultivation, they must be sought for in chance places, nor is the method of obtaining them the less interesting. It is known that the pig has a vigorous appetite for this subterranean morsel. It is a decided passion with the race; so that, as the day dawns, out he is led to perform a duty which, though rather odious and disappointing to him, is particularly lucrative to his master. As the scent of the fox leads hounds to the trail, so the odor of truffles attracts the porker to the cherished bed. He sniffs about this way and that until he locates the desired object, when he immediately begins to root up the earth with his awkward snout. He is closely watched during the operation by his owner, who, upon the swine uprooting the truffle, whacks him sharply over the nose with a stick. In the responsive grunt of pain which follows this brutal blow the soft, moist fungus is dropped from the animal's jaws, and, before he can again pick it up, it is bagged by the hunter. The beast, nothing daunted, presses on to another spot, where, hidden a few inches below the surface of the ground, are more of the epicurean dainties. And thus, after numerous repetitions of the same performance, the animal, thoroughly disappointed, gives up in disgust and submits to being led back to his pen; but on the morrow, thanks to the pig's short memory, the occurrences of the day before are completely forgotten, and he experiences again the same joy and pain, hope and disappointment, expectation and defeat. Recently it has been found that dogs could be trained to perform the duties that are instinctive to the pig. and so great is the demand in France for the truffle that many of the canine species are now, in certain districts, possessed of this estimable talent. The training through which they pass in order to acquire a scent is a decidedly agreeable one. To begin with, finely cut or sliced truffles are mixed daily with their food until at length they develop a liking for the flavor. Afterwards their owners conceal, in some portion of a field where truffles are supposed to exist a little tin dish of *filet aux truffes*, covering the same with a few handfuls of earth. The dog is then brought out and urged to hunt for the dish, goaded by an empty stomach. When he at length finds it, he is caressed by his master, and thus in the space of a few weeks he will readily learn to hunt for the vegetable itself. Truffles are seldom found twice in the same place. A field that may yield a great quantity this year will be quite fruitless the next. Though Alexander Bornholz, a German scientist, claims to have transplanted and raised the article in question, repeated experiments to that end have proved but failures. The Count de Noa, a Frenchman, and a certain M. Rousseau made like claims, but they have in each case been discredited. The very fact that the truffle is a rarity and that it grows only in certain districts has been enough to make it an object sought after clandestinely by peasants or those who carry them to market. There are poachers for truffles as well as for game, who hunt by night with their dog or porker, a plague to landowners and a bete-noire to local gendarmes. Scarcely is there a canning establishment at this moment in France that does not, among other alimentary products, preserve this dainty. It has become as indispensable to the dinner table of the *noblesse* as the aromatic sprig of garlic to the frugal repast of the peasant. The annual production is valued at about $3,000,000. The article is sold in the departments where found at $1 a pound, and at almost double that price at the principal markets of the larger cities. Not alone does the truffle thrive in France; they are found in quantities in Italy, Spain, and Holland, but are of indifferent quality compared with the French, lacking the delicate and incomparable flavor of the native product. In the United States, especially in California, some attention has been given within the past few years to the gathering and preserving of truffles, and a number of Western packers have come to Bordeaux in order to inform themselves regarding the canning process. It is a very simple one, the truffles being partly boiled, like tomatoes, asparagus, and other vegetables, and then jarred and sealed in their own diluted juice. All meat and game products are also 'truffled,' the vegetable being cut into small squares and inserted into the substance of the article preserved."

A NEW MEAT WANTED.

A SUGGESTION FOR THE RAISING OF WILD ANIMALS.

The lack of variety in those meats which, whether flesh or fowl, must always form the groundwork and basis of an English bill of fare is a want keenly felt, but most difficult to remedy. Among the thousands of tons of foreign game imported yearly, there is hardly a beast or bird which may not be had in better quality and condition at home, except the prairie bird and the quail; for those canvas-backed ducks which escape the keen search of the New York dealers and find their way across the Atlantic alight only on the tables of City companies and millionaires, like the caladrus of old, that appeared only at the deaths of kings. Yet there are probably twenty people in this country who have eaten canvas-backed duck for one who has ever tasted swan, or rather cygnet, the finest water fowl for the table, alike in size and flavor, a bird easy to rear, most prolific, rivalling even the breast of a teal, without the fatal drawback of that excellent little bird, that no one has ever been able to get enough of it. Even now, though so neglected by the world, swans may be had from the Norwich Swan Pit for $2 each. They weigh some sixteen pounds, and with them is forwarded an ancient recipe for cooking them, "done into rhyme by a person of quality." Another "fowl" which was once reserved for the tables of kings, and is now hardly thought good enough for Aldermen, is the peacock. What roast swan is to roast goose, such is roast peacock to roast turkey. Many owners of country houses who keep peacocks and let them run wild and nest in their woods and shrubberies, take little trouble either to fatten or to cook the pea chicks. If they did, they would perhaps take more pains to rear these birds for the table. The meat is very white and of exceedingly fine and close grain, and has the true game flavor, with none of the stringiness of the common turkey. But flesh, and not fowl, is what is mainly desired to widen the possibilities of the dinner table. Fatted swans, or peacocks, or American turkeys might be increased and multiplied without affording more than an occasional relief to the monotony of the menu and the brain-searching of housekeepers. What is wanted is some new and large animal, whose flesh has a character of its own which would readily distinguish it from beef or mutton, and an excellence which shall make it independent of any special treatment in cooking—something which shall combine the game flavor with the substantial solidity of a leg of mutton. An increase in the quantity of venison reared in this country naturally suggests itself. It is objected that deer can never pay to fat for food, because the annual growth of their horns reduces them so much in condition as for a time to make the venison worthless. But this applies only to the bucks; staggs might be kept like bullocks, and doe venison might still be remunerative. But swan, peacock and venison are, after all, only revivals of the old bill of fare. To find a new meat, we must take stock of the world's resources of animal food, and inquire after due survey if there does not still exist some neglected quadruped which will furnish what we seek. Roughly speaking, our main supply of animal food is drawn either from the rodents, the ruminants, or the pachyderms—represented by the rabbit, the ox or sheep, and the pig. To vary the supply at our disposal, we shall probably not be able to go beyond these limits; for the general experience of civilized man has already pronounced judgment on the question, and science supports the verdict. It is no good to eat a wolf, for the wolf has already got the benefit of eating the lamb, and left no surplus for us. Of the three great tribes, the rodents may be dismissed from our search; for those that are not already used as food are either too small to be useful, as the lemming, or the guinea pig, or too repulsive in appearance, like the capybara, or in habits, like the rat. Of the pachyderms we find only one which is domesticated for food, the dear familiar Berkshire or Yorkshire piggie. The larger pachyderms are too big; the smaller, like the peccary, too savage; the wart hog and other African varieties, too repulsive. Clearly, then, we must have recourse to the list of ruminants if we are to find one to add to the bill of fare. At first the choice seems wide enough. It embraces all the deer tribe, the wild sheep and antelopes. goats and ibexes, which are numerous; but all have a rank and disagreeable flavor, which must prevent their coming into the list of first-class food. The possibility of extending the supply of venison we have already considered. The wild sheep would probably differ too little in flavor from mutton to make it worth while to domesticate them, though those of the Himalaya will breed freely in confinement. The antelopes, therefore, alone remain, and it is among their number that the animal wanted must be found, if it is to be found at all. If the acounts of African hunters are to be relied on, the venison obtained from the larger kinds of antelope found in South and Central Africa is really excellent, that of the koodoo, the oryx, and the eland being the best. Perhaps the highest and most modern authority available for quotation on the subject is Lord Randolph Churchill. His Lordship's verdict on the eland, the flesh of which is said to surpass that of all other antelopes, as much as Welsh mutton does Lincolnshire "teg," will be of material interest to the present inquiry. Less educated palates have pronounced it "peculiarly excellent, having in addition the valuable property of being tender immediately after the animal is killed, which makes it much appreciated in Central Africa, where the meat is usually as tough as shoe leather and nearly as dry." In addition to the quality

of the meat, the eland has the additional requisite of large size. A full grown eland is as large as a two-year-old shorthorn, and has far more the appearance of a high-bred bullock than an antelope. Its horns are short and straight, pointing backward, and it has a dewlap like an ox. It can live on the hardest fare, and soon grows very fat on good pasture. Best of all, it becomes quite tame, and is easily acclimatized. The writer remembers to have seen a splendid group of these animals in the Jardin d'Acclimation in the Bois de Boulogne, an old bull nearly sixteen hands high, a cow, and two young, apparently a yearling and a two-year-old. They were in good condition, though living in a paddock with only an open shed to shelter them from the weather. The late Lord Derby kept them at Knowsley Park for many years. It seems to be a waste of the resources of nature to allow these fine creatures to be exterminated, as they soon will be, in our new African empire. Why should we not save the eland, the harmless antelope, the koodoo, and other large African antelopes from extermination—and even try to rear some in England? The experiment may be recommended to some of the noble owners of parks and chases who have already done so much to preserve our own deer and wild cattle from extermination. America has allowed the bison to perish. Shall we not take warning, and preserve for our own use the splendid African antelopes which, within the memory of man, were a thousand times more numerous than they are to-day.—*Spectator.*

JAPANESE RAILROAD.—A rack railway seven miles in length is under construction on the Usni Mountain. Japan, to connect the termini of the State railway at Yokahama and Karnisawa. There are twenty-one tunnels, 12,200 feet in length in all, along the line, and the steepest grade is one to fifteen.

BOOKS.

HOW MODERN VANDALS ABUSE THEM.

During the ages which preceded the invention of printing, the owners of richly illuminated books caused them to be decorated by silversmiths and workers in inlay and enamel. Such a book represented years of patient toil, and was consequently a rare and costly object. When not in use it was kept shut up in a box almost as handsomely ornamented as the book itself. It was, without any exaggeration, a gem in a casket. Even when bound in plain leather, with iron or brass bosses, nails, and clasps, a folio edition of the Psalms or new Testament was deemed far too valuable a thing to be left lying on the altar or reading-desk of a church or cathedral. It was chained fast to the wall, hence called *catenatus*. Even long after the coming of the printing-press, books were still the objects of a certain reverence on the part of the common people. These were not allowed to handle books, for the prevailing notion was that they were intended solely for the favored few who could read and interpret them. Putting a book into the hands of a peasant would have seemed like casting pearls before swine. Hence the growth among the people of a sort of dread, mingled with superstitious fear of these mysterious things set with heavy metal clasps and kept concealed from the vulgar gaze. A book and a staff were alike the symbols of priestly power and necromancer's art. Many books were adjudged to be wicked and dangerous and ordered to be burnt by the common hangman—a proceeding which, in the eyes of the common people, augumented the mystery of the printed and illuminated page. Now, however, all this is changed. Books, large and small, are accustomed to be met with. From childhood up, rich and poor alike, are habituated to see and handle them. Their mystery has departed. This wise generation knows that there is nothing supernatural about them; that the paper is simply a film of rag or wood pulp, with inpressions of a mixture of lampblack and oil. This cheapening in a commercial sense has had a like effect in a moral sense. Familiarity has begotten contempt. To state a plain truth, books are no longer treated as well as they used to be. If this bad treatment were confined to cheap books only it would not be so deplorable. The careless reader, however, does not stop to discriminate between good and bad, rare and common. He does not hesitate to put a book to the most outrageous use, such as setting a lamp on it, sharpening his knife on its leather cover, laying fruit rinds upon it, making use of it to hold up a window, laying it down opened with cover upward, leaving it out doors all night, or trusting it into some damp place. There is still another species of devastator, to wit, the man who marks. It is quite immaterial to him how he does it. It may be with thumb nail, pen and ink, pencil, knife point, or what not. Yet, strange to say, these vandals who entertain so little respect for books absolutely assert that they do the book a service. Lamb, Coleridge, Voltaire and Montigne were transgressors of this kind, and were never happier than when scoring over the leaves with pen and ink, and this practice they followed even in the case of borrowed books. Borrowed books! Think of it! Don't you feel the blood tingle to the tips of your fingers in righteous indignation, at the thought of such a lack of respect for objects which have been so justly styled by Jules Janin "*Nos amis nos guides, nos conseils, nos gloires, nos confesseurs*"?—*The Bookworm.*

GREAT VELOCITY.—Astronomers say a shot fired on the equator of Jupiter would travel at a rotary motion with a speed 46 times greater than that of a cannon ball fired at the earth's equator.

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

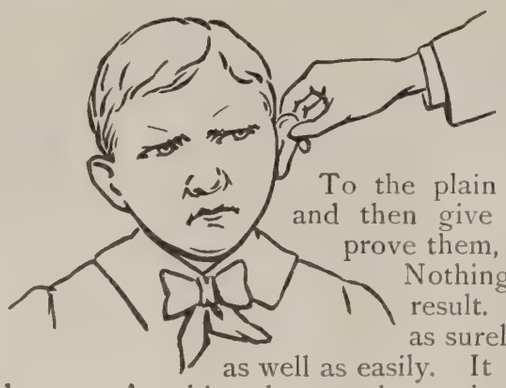
in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.



THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

BUSINESS NOTES.

COCOAS.

It is always wise to purchase goods, especially food articles, of houses whom we know all about or at least whose reputation is such, that when they tell us that their goods are pure, we are satisfied that they are. This is particularly the case with cocoas and chocolates, because there is hardly an article in the market that is more frequently sophisticated than these. Conscienceless foreigners have lately introduced cocoas here made under foreign patents, which are manufactured from such inferior raw material, that they have to add alkalis to partly saponify the fats in order that the cocoa may be soluble; they add noxious dyes and worse mordants to color them up to the standard, and then charging double price for them, spend a fortune to advertise them and depend upon the well-known bias of Americans of a certain stamp to sell these miserable goods at an enormous profit. If our readers would avoid all this let them buy the strictly pure and wholesome goods, manufactured in a cleanly way from the choicest raw material by the old and well-known firm of Walter Baker & Co., of Dorchester, Mass. Every grocer keeps these brands because the well-informed portion of the public will buy no other; they have maintained their standard of excellence for many years and are sold at fair prices. Baker's cocoa will build up and nourish the system while the bulk of this imported trash is absolutely dangerous.

Give Ear

To the plain facts about *Pearline*, and then give *Pearline* a chance to prove them, by giving it a fair trial. Nothing else will give the same result. It washes safely, as well as surely;- it cleans carefully, as well as easily. It is as cheap as soap and better. Anything that can be washed, can be washed best with *Pearline*. It lightens labor and does lightning work. As nearly as we can figure, about eight millions of women use it. Do you? You will sooner or later.

Don't Listen

To peddlers or unscrupulous grocers who offer imitations of Pearline, and say, "it is just as good as," or "the same as" Pearline. IT'S FALSE.—Pearline has no equal and is never peddled.

237 JAMES PYLE, New York.

LIBRARY AID.—The State of Massachusetts has arranged to aid the 103 small towns that have no free public libraries in their efforts to secure them.

WORMS AND FLOWERS.—To keep earth-worms out of flower pots, pour on the soil a warm (80 to 90 deg. F.) decoction of quassia or wormwood and powdered horse-chestnuts. In a few moments every worm will come to the surface and can be removed.

TO CLEAN NICKEL PLATE.—To remove rust stains from nickel-plate, grease the rust stains with oil, and after a few days rub thoroughly with a cloth moistened with ammonia. If any spots still remain, remove them with dilute hydrochloric acid and polish with tripoli.

SUBMARINE ARTILLERY.—A gun to fire under water has been invented, and one for the United States ship "Destroyer" is in course of construction at Bethlehem, Pa. The experimental gun is to be 35 feet long, and will throw a projectile 25 feet in length, containing 400 pounds of nitro-glycerine, 1,000 feet through the water.

BARBARIAN FOLLY.—The princes of India are still able to indulge in royal whims and extravagances. One of them recently had made at Paris a bed worth £5,000. Its canopy is supported by four automatic female figures that wave fans to cool the air. The mattress is a huge musical box which, when one lies on upon it, plays operatic airs.

CARP CULTURE.—Three years ago C. Hachule, of Parma, Mich., purchased two carp to put in a private pond. He estimates that they will weigh from ten to twelve pounds now, and that their progeny will number 30,000. He feeds them with a barrel of bread per week, and when they are called they come to the surface in great numbers to get their rations.

THOUGHT TRANSFERENCE.—Professor Lodge, president of the section of Mathematics and Physics at the late meeting of the British Association, used the following language: "May there not also be an immaterial (perhaps an ethereal) medium of communication? Is it possible that an idea can be transferred from one person to another by a process such as we have not yet grown accustomed to, and know practically nothing about? In this case I have evidence. I assert that I have seen it done and am perfectly convinced of the fact."

A CHEMIST, 27 years of age, educated in the United States (School of Mines, New York) and Germany, wishes a situation in some chemical industry. Excellent recommendations and certificates. Address,

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

ADDRESS **THE ANALYST PUBLISHING CO., 19 Park Place, New York.**

A BUSINESS BENEFIT.

ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.

Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

INSTRUCTIONS TO SUBSCRIBERS.

The Names of all Subscribers are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

No. 10 Spruce St., New York.

ARROWHEAD HOT SPRINGS,
CALIFORNIA.

I MOST respectfully invite physicians of the East to write to me for information concerning this famous Southern California resort. The hot mineral water mud baths, and climate are unequalled in America. Diseases of the throat, lungs, liver, stomach and kidneys, nervous and skin troubles and rheumatism, are the ailments successfully treated. The hotel contains 125 rooms, is first-class, and lighted throughout with incandescent lights. Elevation 2,000 feet. Address,

H. C. ROYER, M. D.,
Arrowhead Springs, San Bernardino Co., California.

The Family Herald,
ISSUED EVERY MONTH,
A CLEAN AND INTERESTING STORY PAPER,
FOR OLD AND YOUNG.
Single Copies, 5c. Twelve Months, 50c.

MUSIC BY TELEGRAPH.

An inventive genius in Austin, Texas, named Hachenberg, has devised a scheme for the simultaneous performance of ten piano-fortes at widely distant points, the manipulation of the keys being transmitted by electricity. The main features of the projected system of musical telegraphy are as follows: The electrical connection of ten pianos for concert purposes, to be operated upon by one player, either individually or collectively. The electrical connection of ten organs for church music, operated in like manner. The reproduction of electro-music at a distance. The electro-musical hall for operatic music, etc., where a great number of musical instruments may be electrically connected, or rather incorporated with the entire inside lining of the building. Electro-automatic music, by transferring the music from an ordinary music box (properly prepared) to the ten pianos. The expression of this class of music is governed by a key-board to be described hereafter. Other combinations are suggested, as of bells, glass and other metallic contrivances. Electro-bell music could be made very attractive, it is claimed. To connect electrically ten pianos, and to operate on them with the best effect, the combination has two key-boards—one that is adjusted to the instrument occupied by the pianist—and has as many keys as there are keys in the piano. By means of this key-board electrical connection is secured with any number of pianos in the circuit. Not to impose new duties on the pianist in playing on these instruments, another key-board of ten keys is under the supervision of a musical director, who makes and breaks the electrical connection between the ten pianos for the purpose of regulating the volume and expression of music. The ten pianos can be played upon simultaneously, or the most rapid run of notes can be secured without taking two successive notes out of the same instrument. By placing these ten pianos in a certain position, the notes reaching the tympanum from different points give the music a timbre said to be both grand and peculiar. The next step, we presume, will be to project the auditory mechanism of the audience by telegraph to the central point of musical distribution, and while the individual is being thus delighted with concord of sweet sounds his other faculties may be otherwise employed. Such an arrangement will be convenient and economical, but its consummation may be somewhat deferred.

SHOULD WOMEN VOTE?

The AMERICAN ANALYST calls attention to the resolutions recently passed by the Working Women's Society apropos of the desire of women to vote. These ladies claim that disfranchisement is a burden too heavy for any class of people to bear, and that poverty, made worse than it would otherwise be by such disfranchisement, compels over a hundred thousand working women in New York City alone to toil on starvation pay. Their appeal to the Legislature, however, will be useless. Men love to make laws which enable them to retain their supremacy.

That is the opinion expressed by the astute journalist, Howard, in his contribution to the *Recorder* on November 11. We fear that his apprehensions are well founded. Judging from the class of men who compose our law-makers, there is little likelihood of the elective franchise being tendered as a matter of either courtesy or right to the female sex. But, after all, the proportion of women who really want it is considered to be very small. It would seem to be an equitable adjustment of the subject to bestow the privilege of voting on unmarried women, or those who are heads of families and property holders. Taxpayers should, of course, have a voice in the selection of the officials who regulate the burdens they are to bear. But the home is a higher sphere for women's effort than the primary and the voting booth; and under existing conditions the good being of society seems to demand that she should prefer to adorn the former rather than weaken her power in efforts to reform and uplift the latter.

LAW PROTECTED PIRACY.

The manner in which the clumsy patent laws of the present time operate to place inventors at the mercy of designing intruders is eloquently stated by Mr. Thomas A. Edison, in a recent interview. Mr. Edison's discussion extended over the whole range of electrical progress, but the abbreviation we give herewith of his comments on the perils and vicissitudes of inventors will be found especially significant. Among other things Mr. Edison said: "The people suppose I have made money out of my inventions. The truth is I have never made one cent out of my inventions. All I have made has been out of manufacturing. My inventions have not been protected by the patent office. The companies with which I am connected have spent millions in trying to defend them. I have spent about $600,000 myself, and I believe I would be $600,000 better off if I had never taken out a patent. What I have made has been because I have understood the inventions better, and have been able to manipulate the manufacturing of them better than the pirates. I could not have made anything had I not large capital back of me, and the ordinary inventor has no protection whatever. His certificate of patent is merely a certificate to the poor-house, and hundreds of inventors are ruined. They spend all they have in getting out their inventions and they die poor. Let me tell you how it works. The inventor has a good thing. He takes out his patent, thinks he is safe, and organizes a plant to manufacture it. He has to have special machinery and he makes special experiments, and, like as not, it costs him $200,000 before he is ready to begin to manufacture. The pirate sees he has a good thing. He decides to compete with him, organizes a company with no responsibility whatever, bribes his men, and starts in opposition. He can in most cases now put up for $50,000 what has cost the inventor $200,000 and he feels that in a few years he can make enough to retire, having gotten the cream of the invention. He begins to manufacture. The inventor prosecutes him, but the court takes three years before they will hear his case. If they decide against him he carries it to the Supreme Court, which is three years behind-hand, and it is from six to twelve years before he can get a final decision. By this time the pirate has made a fortune and the original inventor is in most cases bankrupt. If the case is decided in his favor the pirate is found to be irresponsible and there is no chance for the inventor. What the courts should do is to prevent the pirate from manufacturing until he can prove that he has a right to manufacture. The original inventor, the man who has the papers, the man who has spent his money, should be given the benefit of the doubt.

READ PAGE 562.

When this is done our inventors will have some protection. Then invention will increase in the United States. The country will jump a generation in a decade and eveything will hum."

MENUS.

KITCHEN FRENCH REDUCED TO COMMONPLACE ENGLISH.

The French of the Nineteenth Century chef is not the French of our text books, nor yet the everyday language of Parisian drawing-rooms, but an idiom of the kitchen which we have appropriated with as much readiness as we have the Worth styles, the Sardou plays, the De Maupassant novels and other triumphs of Gallic genius, for it is idle to question the culinary supremacy of a nation that has been accustomed to send its princes and kings into the kitchen as well as under the guillotine. And a few hints regarding the interpretation of this culinary vocabulary may be of assistance to a better understanding of the amiable art of the saucepan. While the Roman epicure began with the egg and proceeded on to the apple, it becomes necessary for us, in obedience to the rule of the French, to begin with the oysters, which, when served in the shell, appear as huitres a l'ecaille, or en demi coquilles. Further on, among the entrees, may be found huitres marinees or picles (pickled oysters), and the small oyster patties known to the cook as bouchees aux huitres, or "mouthfuls" of oysters. Huitres en brochette and huitres frites are respectively broiled oysters and fried. Of names for soups the French cook has a most interesting variety. His general term of potages is etymologically our "pottage," and once meant anything that went into the pot. Strictly, it should be a clear soup. A puree (Latin piperata—"peppered") is a thick soup, made usually of meat, fish or vegetables, boiled to a pulp and strained through a sieve. A bisque (from bis-cuit—"twice cooked") is a soup made of fish, properly of shellfish, boiled and strained. A consomme, the "consummation" of soups, is a clear broth, the result of long-continued boiling. Bouillon is distinctively a "boiled" soup. Then there is the term soupe, a word of German origin applied originally to a thick stew, which, when of vegetables, was called soupe maigre, and when of meat, soupe grasse. Our pea soup becomes puree de pois on the menu, and chicken broth is bouillon de poulet. Soup a la tortue is turtle soup, and consomme de faisans, pheasant consomme. Potage a la printanier is "springtime" soup. Poisson is fish, from the Latin piscionem, and it is curious to note that the phrase poisson d'Avril (April fish) is the French term for an April-fool joke. The names of fish are ordinarily in English on the bill of fare, but to this rule there are numerous exceptions. Ecrevisse, from which we derive our crayfish, is crab, and a crevette is a shrimp. Anchovies, the diminutive fish of the Mediterranean, appear as anchois. Homard is lobster; tortue, turtle; truite, trout: saumon, salmon; and esturgeon, sturgeon, the fish that "stirs" up the mud. An accolade d'anguilles is a brace of eels, and les abbettes is the name that disguises our whitebait. Mackerel, the "spotted" fish, is maquereau, merluche is haddock, and morue is cod. Escargots are snails. For meat the general French term is viands, and this, according as it is roasted, broiled, fried in butter or boiled, is rote, grille, frite, sautee, or bouille. Rissolee is meat roasted to a turn, and when baked it is cuit au jour or au'broche. Stewed meat is cooked en compote or en ragout. Beef the French call boeuf; boeuf a la mode is beef prepared "in the fashionable way." Biftek and rosbif are words borrowed from John Bull, and their meaning is obvious. Veau, means veal; agneau, lamb, and mouton mutton. A gigot d'agneau is a leg of lamb, and a poitrine de veau a calf's breast. Jambon is ham, and pork chop is a cotellette de porc, literally a pork cutlet. Bacon is lard, and when a piece of meat is "larded" it is pierced (pique) with thin strips of bacon. Thus a fillet of beef, larded, with mushrooms, would appear on the menu as Filet de boeuf pique aux champignons. A selle de venaison is a saddle of venison, literally a seat (our "haunch") of venison. Rognons are kidneys, and foie liver. A pate de foie gras, the Strasburg pie of the Germans, is really a "pie of fat liver." Hash is hachis, akin to the Scotch "haggis." Of vegetables the French make two general divisions, vegetables and legumes, the latter term embracing all such vegetables as can be gathered by picking (Latin legere, to pluck), such as laitue (lettuce), asperges (asparagus) and epinards (spinach). In general this appellation covers all "greens." Petis pois are green (literally small) peas, pommes de terre (earth apples) are potatoes, haricots, beans, panais, parsnips, and artichaus articokes. Riz is rice, which should not be confounded with ris de veau (sweetbreads); champignons are mushrooms, oignons onions, chou cabbage; and choufleur, cauliflowner. Our despised "love apples" of a few generations ago, the tomato, is tomate, and celery is celeri. Vermicelli is, of course, vermicelli, the "little worms" of the Italians. Concombres en tranches are sliced cucumbers. Fowls are indicated on the menu by the general designation of volaile. A poulet (our "poulet") is a chicken, and poulet d'Inde (Indian chicken) was the old name for turkey, now currupted into dinde. Allerous de dinde are turkey wings, and dindon a la broche is roast young turkey. Chapon is our capon; oie, goose, and canard, duck. Wild duck is canard sauvage. Becassines are snipes, cailles quail, and faisans pheasants. Grouse is borrowed from our grouse, which is sometimes called also co de bruyere, the heathen fowl. For those articles of diet that we include under the comprehensive designation of "side dishes," or "made dishes," the French artist de cuisine has a variety of names in which he achieves a triumph of nomenclature. Besides entrees he has releves ("removes"), hors d'œuvres ("outworks") and entremets ("intermissions"), the latter having the subdivision of entremets sucres ("sweet intermissions") that include a good portion of the desserts. It is in this branch of the menu that the epicure finds the most attractive exhibitions of the chef's skill—such as the bouchee ("mouthfuls"), galantines ("snowdrops"), and chaufroids (literally "hot-colds"). Chaufroids de perdreaux are cold glazed fillets of partridges. Hors d'œuvres include the light entrees like sweetbreads, crqouettes, patties, hashes of game, macaroni, etc., and the pungent entrees, such as sardines, pickles and other appetizers. Entremets embraces vegetables, the lighter kinds of salads, omelets and other preparations of eggs. When marked sucres, they comprise puddings, cakes, compotes and other sweet dishes. Omelets, by the way, come from œufs meler (mingled eggs). An omelette aux fine herbes is made with parsley, etc., and if it is aux confitures (preserves), it contains jelly or other sweets. An omelette soufflee is a "blown up" omelet. A salade is a "salted" dish (Latin sal, salt), originally, and a fricassee was at first simply a "fuz." Salade de raison is made of the greens that are "in season." Farcie is stuffing, the "force" meat of our cooks. A salmis is an elaborate hash of game or poultry, and a vol-au-vent is a sort of patty of game hash. Quenelles are delicate preparations of stuffing, and timbales are cups. Pate is the common term for pie, and pattisserie is pastry. In its original sense the word meant a "paste," like our pastry. Pudding is a distinctly English word that the French have appropriated and transformed into pouding. Our plum pudding appears on their dinner tables as pouding aux raisins de Corinthe. Raisins are grapes, and raisins de Corinthe are our currants. Raisins sec are raisins as we know them. Some other French names of fruits are prunes (plums), pruneaux (prunes), and poires (pears). Fraise, from which our proper name Fraser comes, is strawberry, and ananas are pineapples, suspiciously like the bananas (bananas). Cerise are cherries from Cerosus, in Asia, where Lucullus is reputed to have found them and introduced them into Western Europe. Compotes are stewed fruits, and confitures are preserves. Glaces (our "glaze") is the name applied to candied fruits and its fancy confections (glaces fantaisies). Biscuit is often a pudding, biscuit glaces being rendered "frozen pudding," and gateaux assorties are assorted cakes. Small cakes are also known as petits fours. Sorbet is sherbet, from the Arabic word that means "something todrink," and fromage, of course, is cheese.—*Advertiser.*

AUTUMN LEAVES.

HOW TO PREPARE THEM FOR PRESERVATION.

A few absolutely perfect leaves are better than the scores of common ones that we are tempted to collect. The leaves of the hard maple are always gorgeous in hue and delicate in outline. Those that wear the deepest tints of crimson or yellow are best for our purpose. Oak leaves are shiny and firm, and easily preserved. Nature has always been prodigal to the beech tree, scattering on her boughs the richest, brightest colors. The sumac glows with vivid crimson, and a clear amber shines through the dainty larch and chestnut leaves. Then there are the dull chocolate and mottled red of the blackberry vines, while the poplar and the aspen shine out with a silvery white, all speckled over with touches of green. Gather these wild wood beauties, says *Good Housekeeping*, with as much care as would be bestowed upon a bouquet of garden blossoms, and hasten home with them before they begin to dry and curl. Upon reaching home let the first care be to have two hot irons ready. Cover the kitchen table with three or four layers of newspapers, over which fasten smoothly a soft cotton cloth. Have at hand a lump of beeswax, tied in a small bag, and a similar package of resin. Now smooth out a leaf with the hand, rub the beeswax lightly over the iron, letting the hot, smooth surface glide quickly over the leaf, first on the upper and then on the lower side, pressing a little more firmly a third and fourth time, until the leaf is thoroughly dry. The glowing colors will be firmly fixed, and will never fade unless exposed to the sunshine. Having treated all the leaves in a similar manner, they are ready for the resin, or "the finishing process." With a moderately hot iron, which must be lightly and rapidly rubbed over the bag of resin, go over every leaf, first on the upper and then on the lower side. This gives them a brilliant, hard, glossy finish that makes them almost indestructible. Many persons complain that the glossy appearance is unnatural. While this is true, to some extent, yet the protection given by the coat of resin could be obtained in no other way. To preserve small branches, and boughs with leaves, one must proceed in the same manner, pressing the limbs and twigs with the iron until dry, being careful to avoid the point where the leaf is attached, as too much heat just there will cause it to drop off instantly. To achieve perfect success, be sure to take the leaves when freshly gathered. When the work has been finished, spread a number of newspapers upon the floor of some unused room, and there place the treasures. Give them plenty of space, so that they will not touch or stick to each other. Cover them entirely with more papers, and let them remain in this cool, dark seclusion until ready to decorate the rooms, or otherwise use them as things of beauty and joy. Reserve a few of the brightest and more perfect specimens for the holiday times, when they will come out of their darkness so beautiful that they who see them will have no longing for summer flowers, but will revel in the unfaded glories of the autumn leaves.

OLD AGE.

IS THE DURATION OF HUMAN LIFE DIMINISHING?

The type of essay *De Senectute*, of which Cicero gave us the model, is not much affected now. Perhaps the Roman orator exhausted the sentimental and philosophic side of the subject. At any rate, the view of old age which most interests moderns is not how to enjoy it, but how to get and prolong it. Perhaps this is really the essential thing, since it appears as if, despite sanitation and all our modern improvements in living, old age is gradually slipping away from us. It is true that we have immensely lessened infant mortality and extended the mean duration of life to over forty-five years. But the average number of old people is not correspondingly increased, and it is even charged that when great old age is now reached, it is abnormal, and the evidence of a deep-seated neurosis whose penalties are visited on succeeding generations. The foregoing statements are not vague generalizations, but based upon carefully collected vital statistics. Sir James Crichton Brown, in a recent address on old age, states that since 1859, in Great Britain, the decline in the death rate has been 17.5 per cent. at all ages under fifty-five, and only 2.7 at all ages above fifty-five. Between the years sixty-five and seventy-five there has actually been an increase in the death rate. The cause of this increment in later death rates is attributed to cancer, heart diseases, nervous diseases, and kidney diseases. These diseases are mainly of the degenerative class, and due to the wear and tear of modern life. This is shown by the fact that the death rates after forty-five are less among women, and less in the country than in the city. Dr. Brown gives us the further discomforting reflection that men and women are growing old before their time. "Old age," he says, "is encroaching on the strength of manhood, and the infirmities associated with it are stealthily taking possession of the system some years earlier than they were wont to do in former generations. Deaths due simply to old age are now reported between forty-five and fifty-five years of age, and in large numbers between fifty-five and sixty, and there has been a reduction in the age at which atrophy and debility — another name for second childishness—kill those who have passed middle life. Presbyopia, or the long-sightedness of old age, in which near objects cannot be distinctly seen unless held at a considerable distance from the eye, is believed by some experienced ophthalmologists to begin, as a rule, rather earlier than it used to do. No trustworthy statistics on the subject exist, and of course general impressions ought to be received with caution, for it must be difficult to distinguish how far the early recognition of ocular failure in these days is attributable to the increased care bestowed on the eye, and how far it should be ascribed to untimely invasion, but I certainly attach great weight to the opinion of Mr. Critchett, who says, 'My own experience, now extending over a quarter of a century, leads me to think that both men and women now seek aid from glasses at an earlier period of life than their ancestors.' Very significant also is the statement of Mr. Brailey that 'people who have lived long in hot climates like India become presbyopic four or five years earlier than they would otherwise have done,' for life in a hot climate really means excessive wear and tear to a European. The ordinary age for the adoption of spectacles for reading used to be fifty; it is now, I believe, nearer forty-five." The teeth are dropping out earlier, baldness is more prevalent, senile insanity is more common, and appears sooner than it used to do; suicide is increasing, and most suicides occur between the age of forty-five and sixty-five. This is rather a doleful outlook, and one naturally seeks to know if Dr. Brown has a remedy for the ills he portrays. "There is," he tells us, "no short cut to longevity. To win it is the work of a lifetime, and the promotion of it is a branch of public medicine. Perhaps one of these days we may have an International Congress on Old Age, with an exhibition of dotards for warning, and of hale and hearty centenarians for encouragement. At any rate you may rest assured that it is by steady obedience to the laws of health that old age may be attained, and by judicious regimen that it may be prolonged." This is all very true, but, unhappily, it has been well known since the days of Hufeland. Perhaps the best and only thing that we can do is to teach children more earnestly the fact that to enjoy the last half of life they must take care of the first half. The maxim, "*Dum vivimus vivamus*" is the one which above all makes old age a sickly and unhappy one.—*Med. Record.*

BUBBLES AND FOAM.

J. L. WILLIAMS, IN "POPULAR SCIENCE NEWS."

The bubbles of imprisoned air seen floating on the surface of disturbed water, and their final product, foam, proceed along quite definite and fixed lines of development. Their sizes present great differences at the time of their formation, and they continue to undergo incessant changes down to the period of their final disintegration. The sizes of bubbles in all liquids, so far as observed, vary as the intensity of the commotion which produces them. This is true up to a certain point, but the maximum of size is speedily reached, and, no matter how great the commotion beyond that point, larger bubbles will not be formed. Although the sizes of bubbles do not readily admit of exact measurements, yet there seems to be good reason for believing that they vary with the temperature of any given liquid, and in different liquids at the same temperature. Hot water seems to be more favorable to the formation of large bubbles than cold, and they persist longer. I believe that cold water, on the other hand, is more favorable to the production of large crests and masses of foam. Such masses seem to be much more abundant at the bases of waterfalls in winter than in summer. This fact may, however, be due to the greater volume of work, and the more favorable conditions for the generation of foam presented by icicles and irregular surfaces of broken ice. The larger size and longer duration of bubbles in hot water is perhaps to be explained in part by the diminished surface tension resulting from a lighter specific gravity, though our ignorance of thermal hydrostatics is too profound to sanction any authoritative statement. That bubbles have different maximum sizes and periods of duration in different liquids is familiarly shown in water which has been rendered viscous with soap. The bubbles are much larger and last longer than in pure water. Even the hard waters of wells cannot be chafed into foam of any appreciable duration, no matter how vigorously they are beaten; while river water laden with surface impurities forms even in the smaller rapids flakes of foam as large as a silver dollar. The genesis of foam from bubbles is a very interesting process. It may be beautifully illustrated by the following simple experiment: Place a little warm water in a basin and rapidly stir it with a cake of soap until a suds is formed. The following facts may then be observed: The suds when first formed consists for the most part of small vesicles, interspersed here and there with large bubbles. These last are quite evanescent, bursting by the rupture of contiguous smaller ones, producing a half crackling, suppressed roar, somewhat like the sound of distant breakers. There is a zone of very small vesicles where the suds comes in contact with the basin, and others of intermediate size interspersed over the surface. The sizes vary all the way from that of a large cuff-button to the point of a pin. If left undisturbed, the larger sizes collapse one by one until the whole mass presents quite a uniform aspect. If, now, this be vigorously restirred, new bubbles, larger than the largest of the first stirring, are formed, but they exist only a few seconds at longest. Their brief existence is probably due to the greater tenuity of the film. I have observed suds, however, in which such bubbles persisted for several minutes. By the rapid collapse of the larger bubbles a uniform size is soon attained once more. Repeated stirrings will produce fewer large bubbles each time, and finally the most vigorous chafing will produce none at all. Meantime, the surging noise has also subsided. The whole mass has a fleecy whiteness; it has reached a condition of partial equilibrium; in other words, it is foam, and will continue to be so until it evaporates and disappears. Foam, then, is a direct product of the continuous subdivision of bubbles, and is formed in nature by the chafing of water against resisting surfaces. A process similar to the one just described is employed in making cake-frosting. In this case the resulting froth consists of minute vesicles of albumen. Not all foam, however, is produced by friction. In the evolution of gases in alcoholic fermentations, and in the froth of soda water produced by the escape of carbon dioxide, there is no visible friction concerned. It would seem that the bursting of bubbles is due in part to evaporation. Movements and tremors are also visible on their inner surfaces before collapse, as if subject to intense strains from within. Doubtless in disturbed water and near resisting surfaces there are tangential pulls which hasten the rupture. This is rendered all the more probable by the existence of a zone of small vesicles (in the experiment) next to the sides of the vessel, where the reaction between the elastic, shrinking mass and the inelastic vessel is most intense. In the case of solitary bubbles, probably the energy of surface tension, combined with a slight excess of pressure of the imprisoned air, hastens the collapse. In aggregate bubbles, as in river foam, there are a number of causes which doubtless conspire to effect their dissipation. Certain it is that such aggregates move down stream a little way only, and then disappear. Generally there are two or three bubbles of considerable size in the centre of the foam flakes, and these are quite liable to burst and produce the instantaneous disintegration of all, when the flakes gyrate round and come to rest in a quiet part of the stream. This is the most common mode of disappearance; but more frequently the foam coming down in irregular patches acquires a rotary movement, and the peripheral vesicles moving more rapidly than the central ones are either thrown off by centrifugal impulses, or wheel around upon the centre and produce mutual destructions. Still another cause of dissipation is the collision of two flakes, generally resulting only in a destruction of peripheral vesicles, and giving birth to two or more new independent aggregates. Oftentimes quite large flakes of foam will ride over several considerable ripples unchanged, and will suffer instantaneous rupture in smooth and quiet water. Cataracts, riffs, billows and breakers all form bubbles and ultimately foam. In all cases except the first they are formed by the backward movement of a crest or spray which entraps the air. The existence of all bubbles in free water is of exceedingly brief duration. It may, however, be prolonged by various devices. Bubbles formed on water, the surface of which has been covered by a film of petroleum, often exist for an indefinite period. The reason seems to be that the viscid oil abolishes the energy of surface tension, which we have seen to be such an important factor in the rupture of bubbles. Bubbles produced by the respiration of aquatic animals, or any other evolution of foreign gases, generally rise as a series of ebullitions, several forming at a time and moving radially from the centre of disturbance. The bubbles ascend so rapidly from below that their reflecting surfaces appear like glistening rows of pearl beads or superimposed hemispheres. Very different in origin, though similar in appearance, are the columns of effervescence which rise in boiling water. They are simply waves of rarefied water which ascend to the surface. Foam may, however, form in this way by the air becoming entrapped at the surface, as it does on sap-vats when intense heat is applied.

BRIGHT STORIES.

A MYSTERY OF THE MIND.

JULIAN HAWTHORNE, IN PITTSBURG "BULLETIN."

I landed in Southampton on the 14th of November, 1872. It was late of a Saturday afternoon, and by the time my baggage was at the railway station there was barely time to catch the last train to London. A few hours later I was in my room at the Westminster Palace Hotel, for it was of course much too late to think of hunting up Madelaine. I must wait until the next day.

I passed a restless night, for I could not rid my mind of a misgiving that had been weighing upon it for several weeks past. This misgiving was none the less oppressive because it was not founded upon what could be called a fact. Facts are by no means always the most persuasive part of experience, and a conviction may be none the less a conviction because it is impossible to furnish a matter of fact reason for it.

I had been away from England four years in all. Most of this time had been passed in New Zealand, as editor and, finally, as proprietor of a newspaper there. I had partly made up my mind to settle there and have Madelaine come out and join me, or perhaps to return and be married to her in London and take her back with me. But when her letter came, informing me that she was "not very well," I formed a sudden determination to sell the paper and return for good and all. It was not so much what she said as a certain depressed tone apparent throughout her letter that impelled me to this step.

The letter had reached me on the last day of July. I made my arrangements promptly, and succeeded in disposing of my newspaper on favorable terms. I then wrote to her that I was coming, and a few weeks afterwards I embarked. The idea of returning home in comparatively prosperous circumstances to marry the woman I had loved so long filled me with happiness, and during the early part of the voyage I was in excellent spirits. Then came the mystery; and from its effects I had suffered ever since.

No doubt the situation, in other respects, did not call for anxiety. Madelaine, like myself, was an orphan, but I believed her to be in good hands. Mrs. Trench, the executrix of the will and the girl's guardian, had a good business head, great force of character, and was in all respects an uncommon woman. She was a widow, and for years had conducted her late husband's business in a masterly manner, paying off one by one the heavy debts which had been contracted, and establishing it upon a paying basis. She was a second cousin of Madelaine's, and the girl and her £20,000 could not have been left in safer or more capable hands. I had gone abroad completely at ease on that score. All the same I was very ill at ease now.

When I looked out from the window of my hotel room that Sunday morning I was confronted by a dense and dark London fog. My watch told me that it was eight in the morning, but it might have been that hour in the evening for all the daylight there was. I dressed and went down-stairs, and by nine o'clock I was in a hansom, on my way to Courtfield Gardens, Earlscourt, where Mrs. Trench and Madelaine lived. The distance was not great, but the fog was so bewildering that we were nearly an hour in reaching the place. At last the cabby drew up in front of the house, and I jumped out and ran up the steps. I was very much excited, but I tried to fight down all dark thoughts, and the anticipation of seeing Madelaine once more sent the blood tingling through my body.

A servant opened the door and stared at me inquiringly. I asked whether Mrs. Trench was at home. The girl replied that no such person lived there. Miss Madelaine, then? The girl shook her head. "It's Mrs. Forbes' family lives here, sir," she said. And she added, in response to my startled inquiries, that they had been in possession not much over a month.

I demanded to see Mr. Forbes, who turned out to be a portly and respectable British merchant; but he could give me little available information. He had only seen Mrs. Trench once; of Madelaine he knew nothing. The negotiations had been conducted through the house agent. I obtained the address of the latter, and returned to my hotel in a very unenviable frame of mind indeed. Being Sunday, I was forced to remain inactive till the next day. I now felt sure that Madelaine was dead. But how did she die? And why had Mrs. Trench, who knew I was coming home, left no trace or clew for me to find her? It had an ugly look.

Next morning the fog still continued, but I was at the house agent's office almost as soon as it opened. Here, too, my investigations were far from reassuring. The agent had never seen Mrs. Trench at all. A gentleman had called on him and transacted the business on Mrs. Trench's behalf. This gentleman had not given his name, but was described to me as a tall, slender personage, with a dark beard and eyeglasses. More he could not tell me.

From the agency I drove to Mrs. Trench's place of business, in Leadenhall Street. I did not expect to find her there, but I could scarcely fail to learn her whereabouts. To my astonishment I found the store in the hands of strangers. Trench & Co. had made an assignment nearly a year before, paying eight shillings on the pound. No one knew where Mrs. Trench was, nor could any one give me the least information about Madelaine.

I was now not only thoroughly alarmed, but also thoroughly aroused. Evidently there was some black secret here. I would fathom it at whatever cost. Who was the black bearded man and what were his relations with Mrs. Trench?

A hundred doubts and questions assailed my mind. The assignment was another ominous feature; for I remembered, with a new shock of apprehension, that in case of Madelaine's dying unmarried, her property would fall within Mrs. Trench's reach; the exercises of a few legal subterfuges would enable her to get possession of it. If there had been a crime, here was a motive. But was Mrs. Trench capable of a crime? Why not? I knew her as a woman of untiring energy and indomitable purpose. She had shown these traits in rehabilitating her husband's business; but, if an evil end instead of a good one were in view, why should not the same qualities find exercise in that direction? I could give no reason why not.

In order to be prepared as far as possible for the worst, I went to the registry of deaths and consulted it for the name of Madelaine Tredwick. It was not there—reckoning from the date of her last letter to me. This was so much to the good. Of course, she might have died elsewhere, or she might have met a fate to which death would be preferable; but, on the other hand, all might not be so bad as I feared. To be able to hope was at least something.

This brought me to Monday evening, and I went back to my hotel and slept heavily till morning, for I needed sleep. When I awoke there was an unwonted light in the room, which faced the east. I looked out, and for the first time since my arrival in London saw the sunshine. The fog had withdrawn its hideous shadow for the present. With that unreasoning sympathy which the weather often arouses in the mind, I felt my own mood brighten. If Madelaine were alive, I would find her yet. But that "if" was terrible.

The first person I saw as I came down the steps of the hotel after breakfast was Robert Heath, my classmate at Oxford, and formerly my intimate friend. He was a barrister by profession and a good fellow down to the soles of his boots. I called to him; he turned, recognized me, and a broad smile of pleasure and surprise illuminated his honest visage. He grasped my hand, asking a score of questions, and welcoming me back to England with word, tone and look. As I talked to him all my old feeling of trust and affection came back to me. This was the friend I needed; not so much for whatever practical help he might afford as for the encouragement and consolation of his presence and sympathy. After we had stood awhile, I asked him which way he was going. He answered that he was bound across Hyde Park and on through Maida Vale to call on a client in Carleton road. "And being a fine day," he added, "I started early and was going to foot it. But if you'll come with me we'll take a cab."

"A walk is just what I need," I replied; "and there's something I want to talk to you about." So off we started, and, as we tramped along, I unfolded to him the whole story of my fears and purposes. He listened attentively and seriously. When I had finished he considered for a while, and then said: "It certainly looks rather fishy. But—"

He never finished the sentence. We had by this time nearly reached the end of Maida Vale, and had turned to the left down Carleton road. The houses in this reigon were detached, each standing in its own inclosure, protected by high brick walls. I saw a cab drive up to one of these houses and a lady in a black dress alight and ring the gate bell. Though I was fifty paces off, I recognized Mrs. Trench immediately. She did not see me, and in another moment the gate was opened, and she disappeared within. "Did you see that?" I exclaimed, grasping my companion's arm. "That is she!"

"Mrs Trench? That's odd! And the house she went into is my client's!"

"Who is he?"

"His name is Glenn—Dr. Glenn; the house is a private lunatic asylum."

"Good God, Bob! May not that be the solution of the mystery? Suppose Madelaine were—" I could not finish the sentence.

"To tell you the truth," replied Heath, "I was thinking of something of the kind when you interrupted me. People are still sometimes disposed of in that manner when circumstances demand it. And, by the way, it was about some question of transferrence of property that I was going to see Glenn. There is something about the affair I didn't quite like the looks of, and I intended, in case he failed to make satisfactory explanations, to refuse to have anything to do with it."

(*Concluded next week.*)

AMERICAN CITIZENSHIP.

DOMESTIC VINDICATION OF THE ABUSED AMERICAN PIE.

A certain mother, who had been seized with the Anglomaniac fever, endeavored to keep house on strict English theories. Certain American dishes were never to come upon her table, and on the list of the banished were pies, "pizen things," as they were by her then considered. This rigorous exclusion of the national dish, which is universally considered one of the corner-stones of the Constitution of the United States, resulted in a little rebellion right in her own family; for her children, as they grew older, realized that they were being deprived of their "inalienable rights," and not wishing to grow up and become deficient and incompetent citizens, simply from a lack of pie, demanded its restoration, so that American pie finally reappeared on that Anglomaniac table, at first by way of compromise, under the name of "tarts." The mistress, realizing that pie neither affected the health nor the social standing of the family, now permitted pies to appear in their native loveliness, and the children rejoiced in genuine, unmitigated American pie, including all the varieties of apple, pumpkin,

mince, berry, etc. Moreover, in explanation of the surrender, the lady declares that her children all have good clear skins, and that a good pie is just as easily digested as any other dessert, and that the fact of its being wholesome or unwholesome depends, as is the case with most food, on the cooking.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEATS.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUITS. — Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

CREAM SOUP.—Take one quart of clear soup and heat it to the boiling point, then add the yolks of two eggs, well beaten, with half a cup of cream, and serve at once without further boiling.

STEWED CHICKEN WITH CREAM.—Boil a chicken until perfectly tender, then remove the meat from the bones and cut it into narrow strips. Put two heaping table-spoonfuls of butter over the fire in a stewpan, and when melted add three even table-spoonfuls of flour, and some pepper, salt, and mace; pour a few spoonfuls of the chicken stock on this, and then add a cup of rich cream. Put the chicken into this sauce, and simmer for a few moments before serving.

EPICUREAN OYSTERS.—Put into a saucepan over the fire three table-spoofuls of butter, one table-spoonful dry mustard, pepper, and salt; when they begin to boil put in about half a pint of oysters, drained out of their liquor; have ready a very hot dish, and as the oysters are done take them out of the butter with a fork and lay them on it, and put some more to fry, and so continue until all are done.

VEGETABLE OMELET. — Boil until quite tender a pound of potatoes and half a pound of carrots, then rub them together through a wire sieve with a wooden spoon; then add a beaten egg yolk, salt and pepper to taste, and a good teaspoonful of butter; rub and beat these ingredients into a thick paste. Butter a baking dish and sprinkle it plentifully with bread crumbs and put in the mixture; sprinkle bread crumbs and bits of butter over the top, and bake for about thirty minutes, or until the crumbs are nicely browned, then turn the omelet out whole onto a platter, and serve very hot.

MOLASSES COOKIES.—One cup of molasses, one large table-spoonful melted butter; one dessert-spoonful of ginger, a little salt, one teaspoonful soda dissolved in half a cupful of cold water; flour enough to roll out. Bake in a steady oven.

ORANGE PRESERVES.—Slice very thin one dozen Messina oranges, and put with them the juice of two lemons; measure them, and add sufficient water to make three and a half quarts, and let it stand overnight. In the morning put it on the fire, cover, and boil until soft, then add five pounds of sugar and boil for about three-quarters of an hour or until the oranges are clear.

GRAHAM PUDDING.—One and a half cupfuls Graham flour, half cupful molasses, one cupful chopped suet, butter or lard; half cupful sweet milk, one egg, one teaspoonful soda, one cupful stoned raisins (other fruit, if desired), one teasponful cloves, one teaspoonful nutmeg, one teaspoonful cinnamon. Steam two hours and a half.

EUROPEAN SOAP.

HOW TOILET SOAPS ARE MADE IN GERMANY.

Owing to the different conditions of the oil market in Europe as compared to America, the raw materials for the soaps made there are somewhat differently regarded in Germany from what they are here. Cocoanut oil and palm kernel oil largely predominate there while wool fat, linseed oil, horse fat, and recovered greases are given special attention in connection with the many problems which confront the German manufacturer in regard to the proper procedure in the many soaps which he makes on a small scale. For it must be understood that there the number of even comparatively large factories is exceedingly small when compared to that of the very small factories that make their boiled soaps in batches of 3,000 to 4,000 lbs. or less, in a kettle heated by an open fire, and with hardly as much as an indistinct recollection of having heard that in some parts of the world soap is crutched by machinery. Besides the difference in the raw material used mostly, and the small scale on which the German manufacturer generally operates, there is also the difference in climate as well as of usage and popular taste, which calls for one kind of soap in in one country and for other kinds elsewhere; so, for instance, boiled-down soaps are used to a much greater extent in Europe than they are here, and again, as owing to their moist climate soaps dry less rapidly than they do here, such kinds are greatly made as would prove almost insoluble in our climate after storing for some time. Then, too, soft soaps are made in Germany in incredible quantities. But, to come to our subject of toilet soaps. It will be seen from the following description by Dr. Bering, a German soap manufacturer, that in the matter of toilet soaps the difference between the countries is less marked, only that they make a much larger proportion of their toilet soaps by the cold process. In a detailed description of the process Dr. Bering writes the following, from which some of our readers can perhaps gain a useful wrinkle or two: "The soaps turned out by our perfumers are made either directly or indirectly by remelting or by milling. In the two last-named processes soda soaps are used which must be free from odor and perfectly neutral, must be easily melted on heating, and, in spite of greater solubility—must yield a more abundant and solid lather than the boiled soaps." [We presume the author meant to say "the ordinary boiled soaps," since the remelted and the milled soaps are most generally boiled soaps.—Ed. *A. S. J.*] In the first-named process the fats are melted at the lowest pos ible temperature, not above 65 deg. R., and one-half of the lye to be used, at sp. gr. 1.33, is run in while stirring steadily; after one half to one hour, according as the mass shows a tendency to become solid, the remaining lye is added, and when the mass appears to be perfectly homogeneous throughout, the color and perfume are stirred in. Now the soap is run into rather strong wooden frames, which are covered inside with linen cloths of close texture, and sufficiently large that the entire block of soap can be covered with them. The square forms consist of side pieces about one and a-half to two feet long and one inch thick, and a bottom of the same thickness. The side pieces are provided with pegs that fit exactly into corresponding holes in the bottom and walls, so that they can be easily put up or taken apart. Iron braces resting in notches on the side pieces give the frames the necessary strength to hold the batch of soap of say one cwt. After framing the soap, the whole is covered with thick cloths in order to keep in the heat which develops. As soon as the soap has become solid the cloths are removed, the soap is allowed to get cold, the side pieces are then taken off and the linen cloth is removed. The soap is now ready for cutting and pressing, care being taken to warm the bars previously if they have become too hard, in order to avoid crackiug. After pressing the cakes are trimmed in order to remove any unevenness on the edges. The fats used are lard, tallow, cocoanut oil, palm oil, and less frequently almond oil. The lard and tallow must be previously purified, and especially the latter has to be freed of its disagreable odor. In running the melted grease into the kettle it is passed through a cloth. The manner of adding the color depends on the nature of the latter, heavy, earthy, or metallic colors, such as umber or vermilion, being added only when the soap has acquired a thick consistency, while dissolved colors may be added while the soap is still thin. Very few colors only can be added before all the lye has been run in and saponification has begun. Aniline colors almost disappear at first under the action of the alkali, but return after cooling. Marbling of the soap is done by stirring up the required color in melted cocoanut oil, running it into a funnel closed at the lower end by a finger, and letting the contents run over the soap as it is run in layers into the frame. When the frame is full a stick is drawn in fancy figures through the soap to distribute the color. Practice is the best teacher, not only in the use of different fats, whether cocoanut oil alone, or with tallow or lard, or with both, is to be employed, but also in deciding whether soda lye alone shall be used or potash lye added to it. Those who work intelligently will soon find which will bring them to the result they desire. The second process, remelting, which is largely practiced in England, consists in finely chipping the tallow soap procured from the soap maker, melting it over a very slow fire while steadily stirring, adding the perfume, mixing well, and framing. If a soap smells too strongly of tallow it may be purified by melting it over a very slow fire or in a water bath, together with one-third its weight of water, preferably rose water, and adding a small quantity of salt to separate the soap again; run it through a sieve, as close as possible, and let cool. Repeat if necessary. In the matter of soap, of course, cheap goods are always wanted and the demand was supplied by incorporating more and more water in the soap. Cocoanut oil soap is especially adapted for this purpose, not only taking up considerable water itself, but communicating the same property to other fats. Such soaps, however, by the evaporation of the water, soon lose their shape and appearance.—*Amer. Soap Jour.*

SLIGHT ERROR.—Customer: "You made a mistake in my prescription the other day. It call for ten grains of opium, and I got a small package containing magnesia." Druggist: "Are you sure about it?" Customer: "Yes; here is a duplicate prescription from the physician. Now the question is, who got the opium?" Druggist: "Dear me, that's so; (to the prescription clerk) "James, who's dead in the neighborhood.

NOT IN THE CONTRACT.—A glass eye may serve as a substitute for the genuine article on some occasions, but there are times when it doesn't fill the bill at all. Here is Mr. Katz, who has brought suit in the New York courts to compel his newly-wedded wife to abide with him. She refuses to do so upon the ground that he has an artificial eye, which fact she had not been made aware of prior to their marriage. The outcome of the suit will be waited with interest by one-eyed husbands.

NO DOCTOR'S BILL.—When a rich man calls in a physician he does not expect that he will be presented with a bill for medical services. In fact, no such thing as a doctor's bill is known in Japan, although nearly all the other modern practices are in vogue there. The doctor never asks for his fee. The strict honesty of the people does not make this necessary. When he is through with a patient, a present is made to him of whatever sum the patient or his friends may deem to be just compensation. The doctor is supposed to smile, take the fee, bow, and thank his patron.

THE COLUMBIAN EXPOSITION.

WORLD'S FAIR NOTES.

Florida, at its recent World's Fair convention, decided to raise $100,000 for its representation at Chicago in 1893.

The Associated Press has applied to the Grounds and Buildings Committee of the Exposition for suitable space, either in the press quarters on the grounds or in a separate building, where its reports can be prepared and dispatched during the Fair. It is certain that the Exposition authorities will provide extensive press and telegraph facilities, but the details are not yet determined.

Between 340 and 350 men are employed in perfecting the landscape features of the Exposition site. It is the intention to make the grounds exceedingly beautiful by walks, drives, lawns, terraces, fountains, shrubbery, and flowers. Several hundred thousand dollars are to be expended for this purpose.

The First Infantry Regiment, National Guard of California, has decided to attend the Exposition in a body, and has inaugurated a plan for providing for the expenses of the trip.

The Palace of Music at the Exposition, it is now expected will stand on the great island formed by the lagoons, and will be surrounded by a magnificent garden of flowers, ten acres or more in extent. This location is desired by Theodore Thomas, Musical Director of the Exposition, but has not yet been finally passed upon by the Board of Directors. The structure will measure 150 by 250 feet, and cost approximately $100,000.

The National Association of Woolen Manufacturers and the American Pottery Association have each decided to make an exhibit at the Exposition such as has never before been seen in this country.

Sir Walker Bullard, who owns the finest collection of native Maori curiosities and paintings in the world, has applied for space in which to display his collection, and intends visiting the Exposition with his family. Maj. John Wilson of Auckland, has submitted a proposition to the Foreign Affairs Committee to bring a colony of Maoris to the Exposition, house them in one of their native-built forts, and let them show their native costumes, home life, and methods of warfare. The proposition is regarded with some favor, as it would add greatly to the value of the general ethnological exhibit of the Exposition.

Theodore Roosevelt, the civil service champion, wants to have an "American Sportsman's Exhibit" made at the Exposition. In explanation of his idea he says: "I want an exhibit of every weapon and utensil used in hunting, fishing, and trapping since the discovery of the country down to the present day. We have the greatest hunting country on earth. The Boone and Crockett Club, of which I am a member, is enthusiastic over an exhibition of the kind, and we want nothing in it but what is American. For instance, I know where the rifles used by Davy Crockett and Daniel Boone can be secured. Nothing could be more interesting than a collection of the kind. The exhibition should embrace the heads of all kinds of American game of the larger sort, and specimens of the smaller game, animals, birds, and fishes; the old wigwams, hunting shocks of pioneer days, all kinds of weapons, and all the conveniences that go to make up a modern hunting camp."

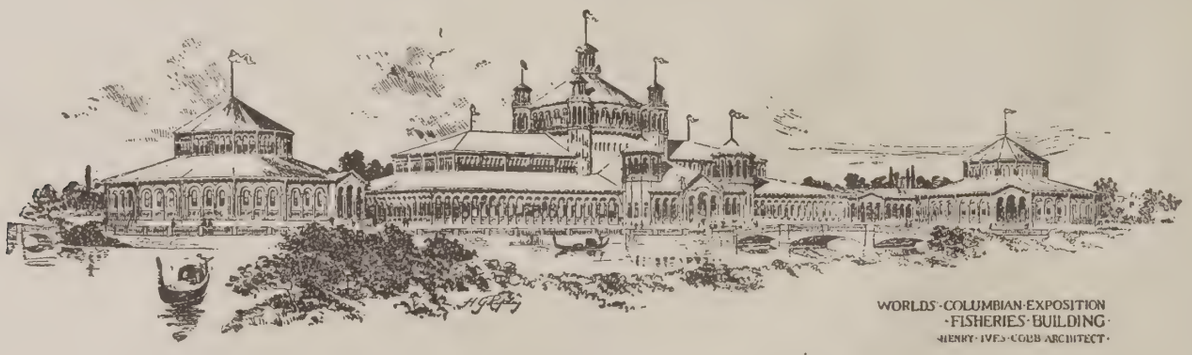
Director George Schneider has received advices from Berlin to the effect that the associated chemical works of the German Empire had agreed to make a full and comprehensive exhibit at the Exposition in 1893. As is well known, the German Empire leads all the world in the matter of the chemical manufactures, and the exhibit thus determined upon cannot fail to be one of the most attractive and instructive at the Exposition.

All Indians who wish to take part in the Indian Congress at the World's Fair are requested to communicate with H. J. Jaxon, who is Chairman of the Committee of Reception and Arrangements for Visiting Indians. Mr. Jaxon's address is No. 170 Washington Street, Chicago.

Exhibitors of the World's Fair can have their empty cases in which their exhibits are transported to the Exposition stored during the Fair for 2 cents per cubic foot; or stored and insured for 2½ cents per cubic foot. The latter rate is less than one-sixth what was charged exhibitors at the Paris Exposition of 1889.

A New York company that manufactures self-winding clocks has offered to furnish free of cost all the time-pieces that will be needed in the buildings during the Fair.

A mammoth labor congress is to be held in Chicago in 1893, under the auspices of the World's Congress Auxiliary of the World's Columbian Exposition. Burns and Tom Mann, who led the great London dock strike to a successful issue in 1889, have promised to be present, as have many other prominent labor leaders. Wm. E. Gladstone and Cardinal Manning have accepted honorary membership, and will submit their views in writing. T. V. Powderly, Carroll D. Wright, and numerous others deeply interested in labor questions, are earnestly supporting the movement.



THE HORTICULTURAL BUILDING.

Ivan Malakoff, a St. Petersburg capitalist, wants to reproduce at the Exposition a street scene from Nijni Novgorod, the celebrated place where expositions have been held for 800 years. He agrees to spend $250,000 upon the reproduction.

A company has applied for space to erect a building in the form of an iceberg in which to make a polar exhibit. A group of Esquimaux, with reindeer, furs and all the paraphernalia of inhabitants of the polar regions, will be installed in the building if the concession is granted.

The Ways and Means Committee has granted W. L. Libby & Son Company, of Toledo, Ohio, a concession for the operation of a big cut-glass factory. The Company will invest between $50,000 and $75,000 on its plant, which will be located at 59th Street, in the Midway Plaisance, on a plot of land 150 by 250 feet.

Turkey has appointed as World's Fair Commissioners D. Jemal Effendi, Agricultural Inspector at Broussa, and Pangiri Bey, Sub-Director of the Foreign Press Bureau.

The Exposition Directory has called upon the Comptroller of the City of Chicago to sell $1,000,000 of the $5,000,000 of bonds which the city voted in aid of the Exposition. The proceeds, which it is desired shall be realized within ninety days, is to be applied mainly to paying the enormous expenses of the construction of the buildings.

The magnitude of the building operations now going on at Jackson Park can be surmised from the fact that an average of from thirty-five to forty car loads of construction material arrives daily. The Exposition buildings are rising with wonderful rapidity.

COMPRESSED DRUGS.

A NEW METHOD OF PREPARING MEDICINES FOR THE ARMY AND NAVY.

Army and Navy officers, and particularly those of the medical branches, evince great interest in a contract which was awarded at the War Department for a new system of carrying medical and surgical supplies for an army. Ever since the last Sioux campaign there has been a growing demand for a plan by which supplies needed by the surgeons could be placed in a more compact form than liquid, and carried with greater safety and economy. The result is believed to be as near perfection as possible. In a small light wooden chest 23 inches long, 14½ inches wide, and 17¾ inches high, are sixty square bottles containing as many different kinds of medicine, but in compressed tablet form, none of them being any larger than an ordinary peppermint lozenge. One of these lozenges or tablets contains all the necessary ingredients of a famous liniment, and when dissolved in an ounce of distilled water its healing properties are the same as if it was in liquid shape and in a big glass jar. Some idea may be formed of the perfection to which the art of compression has been brought by the fact that if the contents of this small brass-bound chest were liquefied and in their customery jars and bottles they would occupy nearly one-half of the space of a regular freight car. There are two of these chests to be supplied to each battalion of 200 men. No. 1 is marked with the Geneva Red Cross and inscribed, "Medical Supply Chest," while the only difference in No. 2, so far as outward appearance is concerned, is the inscription "Surgical Supplies." With certain kinds of medicine, like cough mixture, used in quantities, a bottle holding a gill of the compressed tablets is equivalent to a gallon of liquid, and should the bottle break the merits of the tablet are not impaired in the least. Contract was awarded for 200 of these chests, and one of each kind is to be placed under the driver's seat of an ordinary ambulance. or in case of field service, and when pack mules have to be utilized, the chests are suspended on each side of the pannier, their weight with contents being but eighty-five pounds each. On the top of each bottle-stopper is the name of its contents, and fixed securely in the lid of the chest is a list of contents for the information of the surgeon or hospital steward in charge. Surgeon J. C. Merrill, of the Surgeon-General's office, who has been supervising and conducting the experiments, declares that the new system will revolutionize the mode of supplying needed articles for an army, and will be of value as well to the National Guard organizations of the various States. Iowa is already in the field with inquiries on the subject of these chests, and it is quite likely that at the next annual encampment of the troops of the Hawkeye State these necessary medical and surgical adjuncts will be seen in abundance. Whiskey, brandy, alcohol and castor oil are carried in liquid form, these ingredients rendering it impossible to form them into tablets, but cod liver oil is compressed. In making the investigations the English army system of carrying medical supplies was examined, but while lightness was obtained by means of wicker baskets covered with raw hide, it was demonstrated that if the hide became dampened it would twist in all shapes and destroy the bottles which the wicker baskets were filled with. Hence a light wooden chest was determined upon, and a New York firm provided what proved to be the best and most attractive looking model. It was accordingly awarded the contract.

THANKSGIVING TURKEYS.

When Benjamin Franklin proposed to make the turkey the national bird instead of the bald-headed eagle, he was indulging in a little quiet satire at the American habit of overeating at Thanksgiving and the Christmas holidays. The evil was apparent to his sagacious eye even in those poor continental days. It has grown since with every year and is to-day the preponderating vice of our people. The Thanksgiving turkey more than symbolizes the fact—it is a part and portion of it. The average patriot, his wife and children believe that they have not performed their duty to themselves, to society at large, and to the old flag on Thanksgiving and the other national festivals unless they have gorged themselves with what is really the official bird of Uncle Sam, the eagle to the contrary notwithstanding. In this manner the innocent gobbler has become the best friend to the physician and pharmacist, and the worst foe to the health and longevity of the American public. The evil has grown with the years. Overeating, plain and simple, overeating with an excess of drinking, overeating without exercise or physical toil have one and all played havoc with the assimilative system. With a healthy man or woman it produces indigestion, colic, cholera morbus and dyspepsia; another series of physiologic consequences are diseases of the liver and kidneys; a third are those of the skin; a fourth of the heart. The evil does not stop here. When well developed it becomes more or less hereditary, and is transmitted from one generation to another in the form of weak organs, devitalized functions, anemia, loss of appetite, insomnia, sick headaches, nervousness, and even greater disturbances of the organization as a whole. It was on account of these facts that a wise physician once said, "More people are killed by eating too much than by famine or starvation." The problem to the physician is very serious and complicated. In the first place he must cure the peptic evils produced by overeating, and in the second he must cure the morbid tendencies which induce men and women to use inordinate amounts of food. To effect these two objects demands time and patience. The entire system must be rebuilded, cleansed, purified and strengthened. The sufferer is a sick man, and needs long continued care and attention. The best course is to follow nature. The body must be clean without. Daily baths with warm water, and gentle rubbing with the towel and hand all over the body, and especially over the abdomen, are a necessity. The system must be supplied with sunlight and fresh air. Walks, rides or drives, tennis, rowing, swimming, croquet, quoits, cricket, lacrosse and ball are invaluable. One rule should be borne in mind. Don't do too much; do what pleases you, and have as much company as you can get in doing it. The sufferer should keep regular hours, associate with genial companions, attend light amusements and read pleasing literature. In his diet he should use fruits as much as possible. They never do harm, and almost always are productive of good. Above all, he should strengthen his vital organs and thereby increase his vitality by freely using Ayer's Sarsaparilla. It cleanses the interior of the body by stimulating the secretory and excretory functions, and thus eliminating all humors of the organization. It is not a rapid process. No process can undo in a few hours what has been done by years of wrong-living; nevertheless it accomplishes its aims. Ere long the sufferer from digestional ailments finds that Ayer's Sarsaparilla has not only restored his health and strength, but has put his system into better condition than it ever was before in his life.

BUSINESS NOTES.

ARMOUR'S DIGESTIVE FERMENTS.

The intrinsic value and permanence of the commercial forms of the Digestive Ferments, as also their freedom from disagreeable odor and taste, depend most largely upon the use of perfectly fresh raw materials, and their absolute protection against taint or contamination during the process of isolation. The liability of injury to raw materials by the formation of albumo-toxin during the time required for transportation from the place of slaughter to the laboratory, is now well recognized as a danger which must be avoided. The facilities of Armour & Co. are obviously unsurpassed for obtaining fresh materials; their laboratory, which is located within a stone's throw of the killing floor, is probably the largest and most perfectly equipped in the world, and their methods of isolating the several Digestive Ferments are the result of careful expert research. They invite special attention to the points of superiority of their Digestive Ferments, and while they are of finer grade and higher power than most products of this nature, they are lower in price than any other brand worthy of comparison. They manufacture non-hygroscopic powdered pepsin, free from all foreign odor and taste, with a digestive power of 2,500 times its weight; scale pepsin of the same qualities and strength; pepsin tablets; glycerole pepsin tablets of pancreatine, and pepsin phosphate. These goods can be obtained of druggists everywhere. Samples will be sent free to any physician addressing Armour & Co., Chicago.

FOR DYSPEPSIA.

Use Horsford's Acid Phosphate. Dr. Lorenzo Waite, Pittsfield, says: "From its use for a period of about eight weeks, to the exclusion of all other remedies, I attribute the restoration to health of a patient who was emaciated to the last degree, in consequence of nervous prostration and dyspepsia. This patient's stomach was in such an irritable condition that he could not bear either liquid or solid food. An accomplished physician of many years experience, whom I called in consultation pronounced his case an incurable one. At this stage I decided to use Horford's Acid Phosphate, which resulted above mentioned."

HUGE FILTER. - A large filter of 1,250,000 gallons daily capacity was recently tested and accepted by the city authorities of Philadelphia for supplying the new city hall with water. The filter is over 20 feet in diameter, is about 12 feet high, and was tested under a pressure of 125 pounds for forty-eight hours.

ARTIFICIAL AGE.—Oak may be given the appearance of age by sponging with sulphuric acid and water equal parts, or what is preferable, staining with umber in thin shellac varnish. Iron work may be treated with a wash of sulphate of soda and heating over a fire, or by brushing a solution of flour of sulphur in ten parts of turpentine, dissolved by heating over the irons, then holding them over an alcohol lamp; heat until the black polish appears.

RUBBER CEMENT —To fasten glass letters, figures, etc., on glass (show windows) so that, even when submerged in water for several days, they will not become detached, use an Indian rubber cement. The best for this purpose consists of one part India rubber, three parts of mastic and fifty parts chloroform. Let it stand for several days at a low temperature to dissolve the cement. It must be applied very rapidly, as it becomes thick very soon.

ROUGH ON MICROBES.—A German physician, who has been experimenting upon himself, recommends sauer-kraut as the best remedy for nervous dyspepsia. One can hardly imagine how so nauseous and indigestible an article could be beneficial to a disordered stomach under any circumstances, unless it be upon the principle which one bacteriologist has suggested as being available as a method of combating disease; namely, that one set or class of germs may be destroyed or driven away by another set. The symptoms of nervous dyspepsia are well known to be due to the development of microbes in the stomach, and to the poisons formed thereby. It is quite possible that the germs of sauer-kraut are so much more virulentor active in character that they are able to subdue and oust from their pre-empted territory the mischief-making germs which are present in this form of stomach disease.—*Good Health.*

FIBER PIPES.—Steam pipes are now made of ramie fiber, and the material is pressed so closely together by means of hydraulic machinery that it has a tensile strength two and one-half times that of steel.

VAST ENTERPRISE.—When the Thomson Electric Welding Company was organized it purchased from Professor Thomson five patents and five applications. To-day the company has 131 patents and applications, besides several which it has in foreign countries.

RAPID PROGRESS.—Chief Barrett, of the electrical department of the World's Fair, is confronted by what appears a unique predicament. He states that owing to the many and rapid improvements being made in electrical machines most manufacturers are afraid to prepare an exhibit until the last minute. By the time the fair opens, two years hence, the fixtures they now have in hand may be, according to Chief Barrett, the most antiquated of "chestnuts."

CREMATION IN JAPAN.—Cremation is gaining much favor in Japan. In the capital, Tokio, alone, there are six crematoriums, and in 1889, of 34,437 deceased persons, 11,023 were cremated. Cremation has increased since it is prohibited to bury within the city. There are three classes of cremation, prices being respectively 28, 9 and 4s. The crematoriums are the property of companies and excellently arranged. The process takes three hours.—*Insurance Post.*

MUSHROOMS AND POISON.—Edmund Collins has been investigating mushroom raising and eating in the United States, and first of all lays down this law for distinguishing the edible from the poisonous: The table mushroom, called *agaricus campestris*, is usually white on the outer surface, and when newly born has gills or under-radiants of a beautiful salmon pink. After a day or two's exposure these turn a mahogany brown. But the infallible test by which this wholesome mushroom—which has by the way a sweet, nutty fragrance—may be distinguished from the dangerous *agaricus fastibilis* is this: In the good mushroom the under-radiants or gills are not joined to the stem. In the bad mushroom this junction is perfect. The United States consume at least $500,000 worth of mushrooms a year, but do not raise one-tenth as many as they ought.

A Tonic

Horsford's Acid Phosphate.

A most excellant and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

WATER CURE.—Hot water taken freely half an hour before bedtime is helpful in the case of constipation, and has a most soothing effect upon the stomach.

TALL TOWER.—The marble tower of the Philadelphia city hall, which rises to a height of 337 feet 4½ inches above the pavement of the court-yard, is to be surmounted by a clock story of iron, 67 feet 8 inches, and this by a pyramidal dome of aluminium, 105 feet 7 inches high, the whole capped by a bronze figure of William Penn, 37 feet tall.

GAS ICE.—Mr. S. P. Sticker, an engineer, of Buffalo, N. Y., claims to have discovered a method of making ice by means of illuminating gas, which may be returned to the mains after use without deterioration. By experiments in the works of the Provincial Gas Co., at International Bridge, Ontario, he produced a temperature of 80 deg. below zero by the use of water and gas only, without chemicals.

MAN'S INSIGNIFICANCE.—If it were possible for man to construct a globe 800 feet in diameter, or, say twice the height of St. Paul's Cathedral and to place upon any part of its surface an atom one-four thousand three hundred and eightieths of an inch in diameter and one one-hundred and twentieth of an inch in height, it would correctly denote the proportion man bears to the earth upon which he stands.

POISONOUS TEXTILES.—A gentleman recently died at Warburton, Eng., under the circumstances indicating poising from arsenic contained in a carpet of a bright crimson color. A London analyst has also reported a case in which a lady had purchased from a well known West-end establishment several yards of a light flimsy printed material of the kind now so much employed for curtains and other household decoration. While working at this material, both the lady and her maid began to suffer from symptoms of arsenical poisoning. The substance was found by the analyst to contain very large quantities of arsenic.

NATIVE TIMBERS.—The United States Department of Agriculture, through the Forestry Division, has commenced an elaborate investigation of the physical properties of American timbers as related to their conditions of growth, and the uses to which they are put. These examinations and tests are to be made on all the commercially useful timbers selected from all parts of the country, and on commercial sizes up to the largest beams ever used, and will prove of value to engineers, architects, builders, railroads, lumber manufacturers and dealers, and to the public generally. They will extend over a series of years, but the results will be made public as fast as obtained. The investigations are being made at the Botanical Laboratory of the University of Michigan, at Ann Arbor, and at the St. Louis Test Laboratory, in charge of Prof. J. B. Johnson.

EYESIGHT OF INDIANS.—Dr. L. Webster Fox is of opinion that savage races possess the perception of color to a greater degree than do civilized races. In a lecture lately delivered before the Franklin Institute, Philadelphia, he stated that he had just concluded an examination of 250 Indian children, of whom 100 were boys. Had he selected 100 white boys from various parts of the United States, he would have found at least five of them color blind; among the Indian boys he did not discover a single case of color blindness. Some years ago he examined 250 Indian boys, and found two color blind, a very low percentage when compared with the whites. Among the Indian girls he did not find any. Considering that only two females in every 1,000 among whites are color blind, he does not think it surprising that he did not find any examples among the Indian girls.

MOORISH MIRRORS.—Mr. Steppani, of Berlin, wants to build a Moorish castle on the World's Fair grounds, and proposes to spend $500,000 on it. He exhibited a structure of this kind at Paris, but its cost was much less. The plans have been submitted to the Committee on Ways and Means, and if they are adopted visitors will certainly be dazzled by the Oriental magnificence of Mr. Steppani's palace. The building, it is proposed, shall be 200x200 feet, one story high, and constructed of brick in the Moorish style. Mirrors will make of the interior a place of brilliant and many times multiplied reflections. One will be likely to lose himself in the maze of beveled and prismatic glass, for it is intended that a feature of the castle shall be a labyrinth where the illusions are to be so perfect that on entering one will think he is advancing to an endless series of colonnades.

Every-Day Economy.

One  *rounded* teaspoonful of Cleveland's Superior Baking Powder does better work than a  *heaping* teaspoonful of any other. Cleveland's is wholesome, leavens best and **leavens most.**

EVERY one in need of information on the subject of advertising will do well to obtain a copy of 'Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. TO ADVERTISE YOUR BUSINESS?

Did you know it could be done at moderate cost? Particulars and samples of humorous papers free to any responsible firm. **PICTORIAL WEEKLIES CO.** 28 West 23d Street, New York.

Mr. Gibbs, of the National Cash Register Co., says since publishing their own paper "The Hustler," their business has increased 300 per cent.

INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY'S SON,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

ADDRESS THE ANALYST PUBLISHING CO., 19 Park Place, New York.

GOLD MEDAL, PARIS, 1878.

W. BAKER & Co.'s Breakfast Cocoa

from which the excess of oil has been removed,

Is Absolutely Pure and it is Soluble.

No Chemicals

are used in its preparation. It has *more than three times the strength* of Cocoa mixed with Starch, Arrowroot or Sugar, and is therefore far more economical, *costing less than one cent a cup.* It is delicious, nourishing, strengthening, EASILY DIGESTED, and admirably adapted for invalids as well as for persons in health.

Sold by Grocers everywhere.

W. BAKER & CO., DORCHESTER, MASS.

IF you wish to advertise anything anywhere at any time write to GEO. P. ROWELL & CO., No. 10 Spruce St., New York.

SWIFT'S

CHOICE

Chicago Dressed Beef

AND

MUTTON

Can be found at all times in full supply and at popular prices at the branch houses in all the larger cities and is RETAILED BY ALL FIRST-CLASS BUTCHERS.

The trade of all marketmen and meat dealers is solicited for our Wholesale Branch Houses, and the PUBLIC MAY REST ASSURED that in PURCHASING OUR MEAT from dealers they will ALWAYS RECEIVE THE BEST.

SWIFT AND COMPANY,

UNION STOCK YARDS,

CHICAGO, ILLS.

THE ORIGINAL AND GENUINE (WORCESTERSHIRE SAUCE).

LEA & PERRINS' SAUCE

In consequence of Imitations calculated to deceive, we call attention to the fact that each bottle of the Original and Genuine WORCESTERSHIRE SAUCE, bears our signature thus—

Lea & Perrins

Beware of Imitations; see that you get Lea & Perrins'

For sale in Bottles only (not in bulk), by Dealers in Sauces throughout the World.

JOHN DUNCAN'S SONS, NEW YORK.

GLENN'S SULPHUR SOAP.

Glenn's Sulphur Soap is the **Original and Best** combination of its kind, and the one now generally in use. For sale by **All Druggists.**

BEWARE OF COUNTERFEITS.

ADULTERATION SCARES.

There are few subjects more easily treated by a skilful writer, who desires to scare up a sensation, than the adulteration of food. It is unfortunately true that there are dishonest men engaged in the food traffic, as there are in every other kind of business known to civilization, and it is also true that a dishonest man, especially if he be driven by competition, will sell dishonest goods. It therefore happens that substances are sold to the public, sometimes, as food, which are either not food at all, or inferior in quality to those which they are represented to be. This is an evil, to expose which is distinctly within the province of the public press. No greater service can be rendered, at least of a secular character, than to put the reader on guard against frauds of this character. No small part of the success of the AMERICAN ANALYST is due to the fact that we have performed services of this character fearlessly, constantly, and with some measure of skill. It is one thing, however, to expose an evil, and entirely a different thing to describe it in such a way as to destroy public confidence. This latter is the error into which sensational writers are almost certain to fall. The reader of one of their articles must necessarily lose confidence, either in the purveyor or in the writer of the article, and it is fortunate, for everybody but the writer, that the public generally may be credited with enough common sense to distrust the writer rather than the great body of reputable dealers. The so-called "Exposure of the tricks of trade," is tolerably certain to be so sweeping and general as to be unworthy of respect, and the general reader recognizes this fact. A conspicuous example of this kind of journalism was the recent publication of a column article in the New York *Sun*, on "Adulteration of Coffee." It begins with the statement that "Pure coffee is expensive, and therefore there are immense quantities of stuff sold as pure coffee which are in reality compounds of various substances which cost less." Then, after specifying "chicory, acorns, mangel-wurzel, peas, beans and flour" as some of these substances, the writer says, "The estimate has been made that the people of the United States who buy spurious coffee under the name of pure Mocha, Java, or Rio are cheated annually to the extent of about $18,000,000." Now it may be true that this estimate has been made. Any other absurd estimate may be made at any time, by anybody, with perfect ease. The question remains whether it is worth while to waste printer's ink on the publication of it. Other sample statements in the article referred to are these: "The general public without expert knowledge is utterly unable to distinguish the counterfeit." "The purchaser, therefore, has absolutely no protection short of chemical or microscopical analysis." "Very few persons will take the trouble to protect themselves from such imposition." "There is a process * * * so as to produce an article that will deceive some experts." The only safeguard the writer of this article suggests (although he does admit that some dealers sell honest goods,) is to buy green coffee, roast it yourself, and grind it with religious exclusion of any adulterants. Evidently the whole tendency of such an article is mischievous, and it does gross injustice to a most reputable class of business men. Nobody of ordinary intelligence doubts that coffee is sometimes adulterated. Nobody questions the notorious fact that what is sold under the trade name of coffee at less than the market price of pure coffee, is a mixture. The inference, however, that people are cheated to any appreciable extent, is unquestionably false. Not one grocer in a hundred sells these mixtures under the claim that he is selling pure coffee. The customer, unless phenomenally ignorant, knows that when he is buying "coffee" for 20 cents a pound he is not getting coffee, and he is therefore not cheated. If he really wants pure coffee, and will tell his grocer so, he will not be cheated once in five hundred times. As was said, it is the mission of the AMERICAN ANALYST to expose the tricks of dishonest dealers. This we do without fear or favor, but the rehearsal of well-known facts coupled with the inference that the great body of dealers in a standard article are guilty of deliberate swindling, is work that is unworthy of any first-class periodical.

SMOKELESS POWDER.

The modifications in the art and practice of warfare that may be expected to result from the use of smokeless powder are as yet purely a matter of conjecture, and most of the discussions of the subject that have been published have been wholly imaginary. For example it has been said that men would be struck down by adversaries whose position was unseen, and whose weapons noiselessly smote with a death wound. A little reflection might have shown those who accepted those blood-curdling statements that an explosion without noise was impossible, and that, therefore, silent powder had not, and never could be, invented. Absolutely smokeless, too, the new powder is not, but it is invisible at very short distances, and is quickly dissipated. A complete revolution in the art of war will not be effected, but, nevertheless, some modifications will be caused by its introduction. A writer in the London *United Service Magazine*, describing the observations made by him at some recent military manœuvres in France, gives what appears to us the first intelligent account of the effect in large operations of smokeless powder that has been published. He states that the new powder was not adopted by the French because of its smokelessness, but simply on account of its superior ballistic properties. The smokelessness is, therefore, at most a secondary consideration. It is not absolute, but for a dense cloud which hangs is substituted a light filmy vapor, rapidly dissipated. If a single man fires in an average state of the atmosphere, the smoke of the discharge could not be seen at forty yards; or in the case of a volley by twenty-four men, at eighty yards. As to the probable effect of smokeless powder in war, fortress guns will still be easily localized with a field-glass, but if the attacking batteries be constructed at long range behind low parapets, the enemy will be at first puzzled to localize them. At all times, too, field artillery, opening suddenly at various places and distances, would, with the aid of smokeless powder, be more difficult to reply to effectively than formerly. In casemates smokeless powder would be very valuable. In open country, the defenders of a position, if they obtain cover behind a hedge, in a wood, or in trenches, whose existence is not disclosed, will be invisible at any distance, say, exceeding three hundred yards; hence they can fire at the enemy's distant artillery or advancing infantry without fear of a return until some circumstance reveals their whereabouts. Finally the writer whose paper we are summarizing expresses the belief that artillery will no longer commence the action as heretofore; the defenders' artillery will evidently find their account in keeping silent and concealed until the et-

READ PAGE 573.

emy arrive within close range. The machine guns will follow the example of the artillery until the attackers' guns have been masked by their own infantry. The preliminary artillery duel will be a thing of the past, and the power of artillery is, if not killed, at all events much weakened by the adoption of smokeless powder. Ambushes, especially against cavalry, will be much more effective than formerly, and the danger of attacking the enemy in position will be increased enormously. The experience of actual war will probably bring to light other effects of smokeless powder.

GOVERNMENT MEAT INSPECTION.

The Meat Inspection Act of the last Congress is likely to obtain a considerable extension during the coming session of Congress. Even if it is not extended to cover meats of domestic consumption, a large increase in the appropriation will be necessary to keep pace with the demands for inspection of goods for export. The amount was raised from $350,000 in the fiscal year ending June 30, 1891, to $500 000 for the year which ends next June. The amount asked for this year for the whole bureau of animal industry is one million dollars. It is expected that as the purposes of the Meat Inspection Act come to be understood, there will be a strong demand that the system of Government Inspection be applied to meats for domestic consumption as well as to those which are to go abroad. Such a demand will put the Government to considerable expense, but Secretary Rusk estimates that it will not exceed five cents per animal, including the microscopic examination. If the law is amended it will probably be in the direction proposed in Senator Paddock's pure food bill last year, with which the readers of the AMERICAN ANALYST are familiar, to extend its operations to meats which are the subjects of Inter-State Commerce. Actual interference with products which are the subjects of local traffic would be beyond the power of the Federal Government, but the requirement that meat should be inspected which is the subject of Inter-State Commerce would practically accomplish all that is sought. The packing houses could hardly afford to distinguish between the meat they prepared for export to other States and that for consumption in their own States. Even if they tried it, the people would hardly be content to have meat which had not been inspected put off on them when all that went to other States bore the Government stamp of purity. The law contemplates a wide extension of Federal activity, but it is likely to be supported by a great many people who care more for the quality of their food than they do for political doctrines.

BREATHING PLANTS.

HOW VEGETATION IS SUSTAINED BY THE ATMOSPHERE.

Toward the close of the last century, the learned Dutchman, Ingenhouss, discovered by experiments that plants inhaled carbonic acid and exhaled oxygen. The chemical nature of these gases was not then known, and the process was described as the breathing of plants; but when the character of the gases was discovered, it was seen that this vegetable process was the very opposite of breathing. It is, in fact, as is now recognized, a process of assimilation. Of the solid substance of plants approximately one-half is composed of carbonic acid, and this is derived wholly from the atmosphere. The atmosphere is composed of *circa* 21 per cent. oxygen and 79 per cent. nitrogen, and contains about 0.04 per cent. carbonic acid, which is taken up by the leaves of plants The supply is maintained by man and animals which exhale carbonic acid continuously; the earth, moreover, contains many other sources of carbonic acid. The leaves of plants take up carbonic acid by means of numerous pores, or "stomata," as they are called, on their upper surfaces, which admit the air into the intercellular interstices where it is taken up by the cells, and decomposed. The principal agents in the laboratory of the cell which undertake this work are the small green granules known as chlorophyll granules, which decompose the carbonic acid, eliminating the oxygen and retaining the carbon which latter again enters into combination with the sap taken up by the roots, forming starch. This process of starch formation occurs only during daylight. At night the starch is converted into other products which are passed further into the tree for the formation of cellular substance or for a reserve, as for example, in the tubers of the potato, or as sugar in beets. The importance of the green coloring matter in plants is thus rendered intelligible. It takes up and assimilates a chief element of plant substance. The leaves are the prime workshops in which plant substance is elaborated, and, *cætera paribus*, the energy of production of plant substance, is proportioned to their area. With this digression let us now return to the breathing of plants, by which must be understood the inhalation of oxygen and exhalation of carbonic acid, as in animals. That such a process is in operation in plants has been known for the past half century, but exhaustive investigations into the subject were begun only in the sixties. It was a common saying, that plants exhaled oxygen by day and carbonic acid by night, but as has been shown, the former was part of the process of assimilation. But the night process is a real process; oxygen is taken in and carbonic acid is eliminated. As a matter of fact, this breathing process is continuous, night and day, only during the day it is concealed by the process of assimilation. Everything that lives breathes. The process of breathing by day is best observed in plants in which the process of assimilation is wholly or partially arrested, as in etiolated plants grown in a cellar. Breathing is a process of oxydation or slow combustion, and as such is necessarily attended with the development of heat. It is well known that considerable heat is generated in rooms in which malt is in course of preparation. This is a consequence of respiration. The more energetic the breathing, or, what is the same thing, the more rapid the combustion, the greater is the degree of warmth generated. And as breathing and life are inseparable, so respiration in plants, as in animals, is most vigorous where life is most intense. When plants are budding vigorously in early summer, their temperature is frequently many degrees above that of the surrounding atmosphere, as may be demonstrated with a thermometer, It is evident that respiration is a process precisely the reverse of assimilation. The latter is a process of formation of plant substance, the former a process of combustion, in which plant substance is necessarily used up. Seedlings in which chlorophyll is not yet formed, being incapable of assimilation, respire at the expense of their own solid substance. If they increase in weight and volume, it is simply because of the water which they take up. The process of combustion or breathing, is maintained at the expense of the organized substance of the plant. Its carbon and hydrogen, attacked by oxygen, undergo combustion, forming carbonic acid and water, which are then given off. Here the question arises. Is the breathing of plants a simple process of oxydation set in action by the oxygen of the atmosphere, or is it a mere secondary product of a process of decomposition and recomposition going on in the plant substance? This question can now be answered decidedly. There is in the living protoplasm of plant cells, a continuous process of decomposition, not due to the action of atmospheric oxygen; the albumen divides into nitrogenous and non-nitrogenous substances, and the latter undergo combustion and consequent elimination. The correctness of this view is demonstrated by the fact that plants from which atmospheric oxygen is excluded continue to make carbonic acid. Decomposition of albumen takes place also under the same condition, as I have demonstrated by careful experiment. This breathing of plants is a complicated process; but we may conclude with Pflüger, that in living protoplasm the atoms are never at rest, and that their combustion provides the force necessary to maintain them in motion. Dead plants give out no carbonic acid except in the process of decomposition. In living plants the energy of respiration and consequent volume of carbonic acid exhaled, increase with the temperature. This is a matter of economic as well as of scientific interest. Potatoes and grain are not dead but living substances, and the cooler the temperature in which they are stored the less the waste to which they are subjected.—*Die Natur.*

RUSSIAN COOKERY.

SOME CHARACTERISTIC THOUGH UNPRONOUNCEABLE RUSSIAN RECIPES.

In speaking of the Russian cook as a wholly civilized being we, perhaps, pay him a compliment. The nation which looks on unmoved at a Jew baiting is capable of ruthless acts in the kitchen, and some of the following recipes may, we admit, shock, the conventionality of the unenlightened, but even in recipes that appear in the reading most unsavory and eccentric, there is often some redeeming quality, and sometimes a pleasing and original savoriness. In almost every case we believe it is better to eat these Russian dishes then to pronounce their names. Russia, it will be seen by what we cull from her kitchen *repertoire*, is a nation which lives on soups chiefly, but they are not the thin *consommes* affected by Western Europe, but rather of the quality of those porridges, those "messes of pottage" that are meat and drink in one. The tea urn (*Samovar*) hisses all day long in Russian homes, and Russian cookery has been described by the critical foreigner as a cruel tyranny tempered by tea. A French cynic goes so far as to say of Russian civilization that it is nothing but *Samovar et Repentir*; but whether the repentance follows upon too much or too bad tea, or too much or too bad cookery, we leave to the reader of these Russian recipes to discover for himself.

RUSSIAN DISHES.

LITTLE RUSSIAN BORSHTSH (BEETROOT SOUP.)—Before making *Borshtsh*, it is necessary to have a supply of *quass*, which is obtained from beetroots in the following way: Scrape a number of beetroots, and put them into an earthenware vessel; cover them with lukewarm water that has already been boiled, and keep the vessel in a warm place for five or six days, when the *quass* will be ready. Pour it off into a jar or bottle to be used when needed. For the *Borshtsh* take as much lean juicy beef as is necessary to make good, strong soup. Cut various kinds of vegetables, such as turnips, carrots, celery, and beetroots, into long, thin slices, strew a little sugar over them, and as soon as the juice begins to appear, pour them all into the boiling soup, adding a dried mushroom and an onion cut in small pieces. The soup must be continually skimmed. When it has boiled sufficiently, pour the *quass* into the soup, regulating the quantity by taste. Then let the soup boil up once, and serve with slices of the boiled meat and of ham. Should the color of the soup be pale, improve it by grating a raw beetroot into a strainer, and then strain the soup through it into the tureen. Sour cream is always served with the *Borshtsh*, and each person pours as much of it into his soup as he desires.

RUSSIAN SCHTSCHEE OR TSTCHI (CABBAGE SOUP).—*Schtschee* is the ordinary soup of the Russian people, and answers to the *Pot-au-feu* of the French. There are two kinds, the one made with *Sauer Kraut*, or sour cabbage, the other with fresh cabbage. For the former, slice finely two large white onions and put them in a saucepan with four ounces of butter and

four ounces of bacon cut in dice; fry a light brown and add a white cabbage, washed, drained, and finally shred; stir all well together and fry a little longer, till the moisture is nearly evaporated. Then sprinkle in the saucepan two ounces of flour, mixing it well with the vegetables and bacon; add three quarts of slightly salted beef broth, and boil for half-an-hour; then put in twelve ounces of small smoked sausages and cook them slowly for half-an-hour longer. Skim off the fat, take out the sausages, cut them in slices, put them again into the soup, and pour the whole into a tureen; add some chopped fennel and parsley and serve.

OOKHA (FISH SOUP).—Cut up in small pieces various kinds of vegetables—parsnips, turnips, carrots, celery, parsley, etc.—and two large onions, and boil them till they become tender. Then put in the fish of which the soup is to be made. The best fish for the purpose are sturgeon, perch, carp, eel-pouts, chub, and even pike make excellent *Ookha*. In Russia the *Sigg* is used, a fish found almost exclusively in Russia and Finland. If it is intended to serve the fish separately, it need only be boiled long enough to cook it thoroughly; but when eel-pouts and small fish are used, it is customary to boil them till the soup acquires the consistency of a jelly. The fish are then taken out, the soup strained and thickened, if necessary, with a little flour and butter; in any case thin slices of potato are put in. Sometimes the *Ookha* is not strained, especially when the fish of which it is made are small.

RASZOLNIK (PICKLE SOUP).—This is one of the best of Russian soups; it is usually a favorite, even with the strangers who visit the country. Take soup that is not very strong, and pour into it the liquor used in pickling cucumbers, regulating the quantity by taste. Cut up two or three pickled cucumbers into small pieces and put in the soup; boil the whole thoroughly, and flavor it with sour cream thickened with flour.

KHOLODNIK (COLD SOUP).—This soup is made only during the heat of summer, and somewhat resembles the famous *Gazpacho*, the "vegetable soup or floating salad" so dear to the Spanish peasant. *Kholodnik* is made as follows: Take a handful of fennel, salt, and the green tops of young beetroots, mince them finely, pour water over them, and let them boil. Make a decoction of sorrel, put in the boiled green top of a young beetroot, and some finely minced fennel, add a little of the water in which the vegetables were boiled, and stir all together. Then pour in three tumblerfuls more of the water, and a tumblerful of good sour cream, mix well, and put the whole on ice or in a refrigerator. Meanwhile, put into a tureen hard boiled eggs, each cut into four pieces. Remove the shells from about thirty crayfish and put them, together with their heads and claws, into the tureen; add some long thin strips of cold veal, and shortly before dinner put in two pieces of ice; sometimes asparagus is added. Then pour into the tureen the soup that has been cooling in the refrigerator, and serve. The *Kholodnik* should be quite as cold as an ice cream.

PILMNEN (MEAT DUMPLINGS).—This is a Siberian dish much esteemed in St. Petersburg, Moscow, and Northern Russia. *Pilmen* are pieces of dough filled with meat and boiled. The paste is made of about one pound flour, a very little water, one egg, and a pinch of salt. Knead it thoroughly and roll it out thin. The stuffing is prepared as follows:—Take one pound of fat, juicy steak, and mince it as fine as possible; add chopped onion with pepper and salt and a little good gravy, which must be quite hot. Mix all well together and put it in a cool place till it becomes quite cold. Then cut round pieces out of the paste, the size of a tumbler round, and place in the centre of each a large teaspoonful of the prepared meat. Fold the paste over it, take care to well cement the edges so that the gravy shall not escape; then boil in boiling soup or water. When the *Pilmen* float, take them out and put them into a deep dish, into which pour a little soup. Serve them with melted butter, pepper and vinegar.

RUSSIAN SOUP DUMPLINGS.—Take two cupfuls of flour and mix with a little salt, yeast, and melted butter, and dilute the whole with a little warm water to the consistency of light bread dough. Knead it well and place the basin near the fire to let the dough rise. When the dough is quite light, roll it out, not too thin, and put in it a layer of finely-minced meat, carrots, or white cabbage, slightly seasoned with salt and pepper. Fold the dough over, pressing the edges well together, and boil it in clarified dripping. If the vegetables are used in preference to the meat, hard-boiled eggs, finely chopped, must be added.

PASTE FOR THE PIROGG OR PASTY.—Take three tumblerfuls of flour, mix with it one tumblerful of tepid milk, and one and one-half ounces yeast moistened with milk. Set the dough to rise, and when it has risen take the yolks and whites of six eggs, beat them up with two tablespoonfuls of butter, add three more tumblerfuls of flour, and knead the whole thoroughly until the dough comes perfectly away from the basin in which it is made. Let it rise again, and then spread it on a pasteboard, and roll it lightly; transfer it then to a well-buttered baking-tin, and roll it out on it till it is as thin as possible. Then lay on it the filling, composed of meat, fish, or cabbage, finely-minced and seasoned, cover it over with paste, cement the edges as neatly and firmly as possible with white of egg, brush the whole *Pirogg* over with white of egg, and place it in the oven to bake thoroughly.

KOOLIBIAKA (FISH PASTY).—Make a round of good puff paste the size of a large plate; on half of this put a layer of boiled rice which has had two ounces of butter mixed with it and is seasoned with pepper and salt; on the rice put a thick layer of boiled fish; carefully taking out all the bones first. On the fish place hard boiled eggs chopped small, sprinkle a little pepper and salt over these, fold the other half of the paste over this, pressing the edges well together. Brush over the top with some beaten egg and strew bread-crumbs over it, then bake it till it is a good brown color. *Koolibiaka* is favorite luncheon dish, and may be made of raw, salted, or smoked fish as preferred.

MEAT PIROGG (PASTY).—Cut up into small pieces 2 lbs. of stewed beef or game. Put a large piece of butter into the stewpan, add a minced onion and the meat, salt, pepper, a few teaspoonfuls of soup, and leave the whole to stew a little. When it is cool again add the whites and yokes of three eggs, and put the whole on the paste which should be rolled out ready to receive it. Then take half-a-dozen hard-boiled eggs, cut them in small pieces, and place them on the meat. Cover the *Pirogg*, brush it over with white of egg and bake.

VARAINIKEE (CURD DUMPLINGS).—This is a favourite dish in the North, Centre, and East of Russia, and in the *cuisine* of the middle classes sometimes does duty as roast meat. It is made as follows: Make paste as for a *Pirogg*, using butter and eggs, and and roll it out on the slab or pasteboard. Take some cheese-curds and roll them up into a ball—about the size of a walnut—with some butter and yoke of a hard-boiled egg. Cut out with a paste cutter or tumbler, pieces of dough like small cakes. Into these put the balls of curd, folding the paste well over so that the curds shall not escape; it is better to cement the edges with white of egg and press them closely together. Boil them in boiling water till they float on the surface of the water, then take them out, put them on a hot dish, and pour melted butter over them. Serve them with sour cream, of which each person takes as much as pleases his taste.

PIROSHKEE (PASTY WITH CHERRIES).—This dish is as great a favorite in the South of Russia as the *Varainikee* in the North. The paste is not as rich as that used in making other kindred dishes, though it is made with eggs like that for the *Varainikee*. Stone about 1 lb. of cherries, scald them well and strew them with flour and powdered sugar; roll out the paste very thin and cut it into rounds, as for *Varainikee*, then put some of the cherries on each round and fold the paste over them, cementing the sides well with white of egg and presssing them together, so that the juice of the cherries shall not escape. Plunge the *Piroshkees* into a saucepan of boiling water, leaving them there until they float on the surface; then take them out, put them on a hot dish, and serve with sour cream and powdered sugar.

VATROOSHKEE (CHEESE CAKES).—Take some sour paste, roll it out thin, and cut it into round pieces the size of a penny bun. Put on these a thick layer of cheese curds prepared as follows:—To three-quarters of a pound of cheese curds, which have been previously well-pressed, add the yolks of four eggs, two tablespoonfuls of sour cream, and one tablespoonful of sugar, and pound them up together. Having put on each round of paste some of this mixture, cover it with more paste, cementing the edges firmly together, and put them into the oven for about half an hour, when the *Vatrooshkee* will be ready.

BLINI (RUSSIAN PANCAKES).—Take equal portions of flour, and buckwheat flour, or oatmeal, and mix them into a light paste with yeast and lukewarm milk and water. Put the paste in a warm place to rise, and when it has risen add to it two or three beaten eggs; mix the whole together thoroughly well and let it rise again. The paste must not be very stiff. Make it into pancakes about half an inch thick and fry them. They are served with butter and caviare, and are universally eaten during Lent.

SMETANIK (RASPBERRY PUDDING)—Put a pound of fresh or bottled raspberries into a small pie dish and let them stand in the oven till they are quite hot, when they must be taken out. Beat up a teacupful of good, thick, sour cream with two eggs, one tablespoonful of flour and one spoonful of white moist sugar. When this is all well beaten together, pour it over the raspberries and bake the pudding in a very slow oven till it is firm. It should be of a light brown color.

KISSEL.—Boil together 1 pint of Russian cranberry juice and 1 pint of water; mix two tablespoonfuls of potato flour in a little water, and when it is quite smooth, pour the boiling cranberry juice upon it. Mix it well and boil it a little more. This is eaten with cream and sugar.

PANES AND PUTTY.—The work of replacing a broken pane of glass may be greatly simplified by running a hot iron around the old putty, which loosens it, when it may be easily scraped off, and the broken pane removed.

GERMAN CONSERVATISM.—Until recently the royal palace at Berlin has been lighted only by candles. Both the father and the grandfather of the present Kaiser were opposed to gas and would not allow it to be introduced into the palace. Emperor William has had gas put in, and is now arranging for electric lights.

DISCOUNTENANCING CELIBACY.—Georgia is going to tax bachelors. A bill for that purpose has been brought into the Georgia Legislature and the House Committee on hygiene and sanitation has reported it favorably. Under its terms it will cost a Georgian $25 to begin the bachelor business at thirty years of age, and on a rising scale of $25 for five years a man of sixty and over will be at the expense of $200 per annum for the privilege of going without a wife.

FIRST COLORED FEMALE DOCTOR.—Novelties in the way of doctors *quoad* race, sex, sect, condition, etc., have become somewhat rare of late. We have recorded the evolution of the first Chinese doctor, the first female homœopathic doctor, the first lady medical Brahmin, etc. Despatches now furnish us with the report that the first colored lady medical doctor has just passed the Alabama State Board and is qualified to practice medicine. The reports are modest, in that the doctress is said to have passed with simply a high average. We trust that Doctress Dillon will be successful. The colored physicians whom we have met have been modest, earnest, and industrious, and they have shown better than many others the capacity for progress of their race.—*Med. Record.*

BRIGHT STORIES.

A MYSTERY OF THE MIND.

(*Concluded from page* 556.)

The idea that Madelaine might be at that moment confined with lunatics within a few yards of where we were standing put me almost out of my self-control, and I was for taking summary measures on the spot. Heath endeavored to moderate my impetuosity by reminding me that, first, Madelaine might not be there; and, secondly, that the law was able to free her, if wrongfully confined, better than any violence on my part could do it. "Let us do this," he said finally; "we will go in together, as Mr. Heath and friend. In that way we can gain admittance to the house. Mrs. Trench does not appear unless called for, and Glenn does not know you by sight. Then we'll find some means of determining whether the young lady is in the house, and proceed accordingly."

For answer I pulled the bell. The gate—an iron barred door, boarded behind and painted a dark green—was opened by a man-servant, who, on seeing Heath, at once admitted him and his "friend," closing the gate after us. But as I was preparing to ascend the steps I stopped short with a startled exclamation. The steps, with the oddly shaped foot scraper at the top; the brown door with yellow mouldings and a brass knocker in the form of a dog's head; the square front of the house, with its five windows protected by light but strong iron gratings; the two fantastically trimmed yew-trees on either side of the entrance—all these things I certainly looked on now for the first time in my life; and yet they were as familiar to me as my own face in the looking-glass.

I could not explain this to Heath, for it was a part of the "mystery" to which I have already alluded, and which I had omitted in the account of my affairs, that I had given him. It is enough to say here that it removed the last shadow of doubt from my mind as to Madelaine's being in that house. The conviction, instead of increasing my agitation, made me suddenly quiet and composed. I felt that the power had come into my hands and that I should know how to use it.

After a momentary pause I followed Heath up the steps and entered the house. We were shown into a large room on the left. At the further end of this room was another door, and almost immediately it was opened by a tall, dark-bearded man, with eye glasses—the man described to me by the house agent and known to Heath as Dr. Glenn. He advanced and greeted Heath with a courteous smile and bowed to me inquiringly. He introduced me as a professional colleague of his advising him in the case. "We may talk without reserve," he added.

He and the doctor then began a conversation to which I did not listen. I could only think of Madelaine being in the same house with me. In what room?

The door by which we had entered had not been wholly closed; it was ajar about a quarter of an inch. I fancied I detected a low, irregular sound, like distant voices speaking somewhere on the other side. Under pretense of examining an engraving that hung near the door, I moved over there. Yes, there were voices, apparently in a room upstairs. Suddenly they grew louder, as if the speakers had emerged into the hall, and then I knew Madelaine's voice.

Without a moment's hesitation I threw open the door and stepped across the threshold. In a loud but composed tone I said: "Madelaine, come down! I am here!"

There was a piercing scream; a quick rush above; a breathless struggle; but I had half mounted the stair and caught a glimpse of the dearest face to me on earth white, haggard, with great black eyes full of love, terror and eagerness. The woman in black had seized her by one arm, but she relinquished her hold on seeing me. In another instant I was holding my girl against my heart, and she fainted there. And there below stood Robert Heath, like a rock, motioning back the doctor. "This will be a very awkward business for you at best, Dr. Glenn," I heard him say. "You'd better let it stay where it is!"

It proved to be an awkward business, indeed, for the doctor and Mrs. Trench. But I will not enter into the details of their discomfiture, nor of the story of how they conspired together to defraud Madelaine of her fortune. Mrs. Trench had, it seems, conceived a passion for the doctor, and had determined to marry him; but about the same time she had met with a series of reverses in business, culminating in bankruptcy; and as the doctor stipulated for a dowry she had conceived the idea of robbing Madelaine. By secretly drugging her she succeeded in making the poor girl delirious, and while in that condition two physicians were found to certify to her insanity. Once imprisoned in Glenn's asylum her death would only be a question of time—and of no very long time either. But when Madelaine, in telling the story afterwards, came to the point where she had been carried in a cab to the doctor's door, not knowing whither she was going, I stopped her and said, "What day was that?" She replied that it was on Friday, the 13th of October, at about half-past 8 in the morning.

"Now listen to this," I said. "I have told it to no one else. I came from New Zealand by way of the Isthmus of Panama. When we were within a few days' sail of Panama, and 5 degs. north of the line, we had a stormy night, and I was on deck until after midnight. Towards 1 o'clock in the morning I went below and into my stateroom. I threw off my oilskins and laid down on my berth with most of my clothes on, for I did not know but the storm might grow worse. As I lay there in the dark, listening to the waves against the sides of the vessel, and the creaking of the timbers, and wondering whether I should ever see England and you again, all at once the end of the room seemed to grow light, and then to fade away, and I saw the front yard of a house, with five windows with light iron gratings, a brown door with a brass knocker like a dog's head, a couple of yews on either side, a flight of seven stone steps up to the door, and a peculiar foot scraper. The yard was enclosed by a high brick wall, with a green door into the street. I saw this door open, and you came in, with a man and a women leading you. The door was closed behind you, and then, as you looked up at the grated windows, you became frightened and began to struggle and cry out. But the man and the woman, whose faces I could not see, dragged you on and up the steps. You continued to struggle, and just before they forced you into the house you turned half around and called my name in a piercing voice three times—'Richard! Richard! Richard!' Then the door closed and you were gone; and at the same moment my stateroom was dark again. I had been half sitting up in bed, and now I got out and struck a match and looked at my watch. It was five minutes past one in the morning; and it was Friday, October the 13th! Now, what do you think of that?"

"Why, Richard, that was exactly what happened. I was dragged in there, and I did call you, and, oh! my soul went out to you! And it was the same day, too—only it was half past 8 instead of 1—"

"Half past 8 in London is five minutes past 1 in the longitude we were in at that time," said I. "I calculated it out the next day and wrote the whole thing down. Here it is!" and I showed her my note book. She read it and said: "After all we loved each other. So it was not so strange." I said, "It was a mystery of the mind." But she answered, "I would rather call it an intuition of the heart!"

Love and Digestion.—The Shan Chinese, a people living between Burmah and China, show their love for their parents by killing them and eating them to save them from the misery of old age.

CHRONOMETERS.

THEIR INVENTION, AND THE TRIBULATIONS OF THEIR INVENTOR.

Previous to the year 1691, watches had only the hour hand, a disadvantage which was removed by Daniel Quare of London, who added the minute hand, an improvement apparent to all. Nine years later the horizontal escapement in its perfected state, by George Graham, F. R. S., the pupil and colleague of the renowned Thomas Tompion, and sometimes called the "Father of English Clockmakers," was made public; and if not the most accurate, is still made on account of its economy in almost countless numbers. Till the appearance of this escapement in 1700, there was no other in existence—with the exception perhaps of some obscure experiments—than the old "vertical," now known as the "verge" escapement. In the same year the ingenious device of jewelling the parts most subject to wear was introduced into this country by "M Facio, a native, of Geneva, who came to Paris with this art as a secret; but not being well received, either by the Duke of Orleans, at that time Regent of France, or by the watchmakers there, he repaired to London with it, which was at that time a school where the art of watchmaking was more cultivated than at Paris." With these explanations we now come to the year 1714, when the English Government appointed a commission for the purpose of investigating the longitude question. One of the members of this body, which was known as the Board of Longitude, was the celebrated Sir Isaac Newton, who prepared an exhaustive paper on the subject, and indorsed the old opinion that a "true timekeeper" would solve the question. This recommendation was laid before Parliament, and shortly afterward there was published "An act for providing public reward for such person or persons as shall discover the longitude at sea." Sir Isaac, who was deeply interested in horology and in touch with all the latest improvements, was evidently sanguine that a true timekeeper could be made, provided the incentive was strong enough to induce any one to devote his time as a means to that end. So the reward was fixed at ten thousand pounds if it defined the longitude to within one degree; fifteen thousand to within two-thirds, and twenty thousand to within half a degree—these distances being respectively sixty, forty and thirty geographical miles. At this time, there were then living several eminent horologists, whose well-known abilities, one thinks, might have induced them to claim this honor; yet there is no authentic record of any application till fourteen years after it was first offered. John Harrison, who invented and made the timekeeper which gained this reward, was born at Foulby, near Pontefract, in Yorkshire, in 1693. Of his early life little seems to be known, further than that he assisted his father, who was joiner and cabinet-maker, and in addition to this occupation undertook the repairing and cleaning of clocks and watches. From this fact it is no doubt traceable that his son John had his great mechanical abilities directed into the channel by which he in after years made himself famous. When quite young he seems to have been an enthusiastic worker among clocks and watches, and is said to have made some of the former with "frames of wood." Although this indicated his constructive and imitative faculties—which in mechanics are indispensable—yet his fame rested on higher attainments than these alone, for, in addition to them, he possessed inventive powers of the highest order, along with a logical mind: and as a scientist in all that related to horological philosophy, his productions are a monument to his talents. The mere making of the separate parts of a watch or clock does not constitute a timekeeper. Each article is subject to its own laws, which were only understood by a long series of observations and experiments. The expansion and contraction of metals through changes in temperature

the varying fluidity of the lubricant, magnetic disturbances, irregular supply of force to the escapement, want of isochronism in the pendulum and balance spring, were all elements of disturbance, and to counteract these was the life work of John Harrison. It is beyond the scope of this article to give a technical description of his inventions; the principles involved, and his intricate mechanism, make even the attempt of anything like lucidity a hopeless task; and in view of this, the remarks thereon must needs be confined to their popular aspect. Harrison, who was twenty-one years of age when the decision of the Board of Longitude was made public, was then, or soon afterward, engaged in devising some means to counteract the expansion and contraction of metals by heat and cold, and his efforts were crowned with success by the production of the "gridiron compensation pendulum." The reward offered seems to have directed his attention to remedy the same defect in a watch, which defect, in long voyages embracing wide ranges of temperature, was one of its greatest failings. With this view, then, he prepared drawings of a scheme, including an original escapement, took the same to London, and there showed to Dr. Halley, who was then Astronomer Royal. In principle, the invention depended on a laminated bar of brass and steel fixed at one end, the free end carrying two curb pins embracing the balance spring; and according as the bar shrunk or expanded, it regulated the length of the spring. It acted, in short, as an automatic regulator. It has since been entirely superseded by more exact methods. Dr. Halley, seeing there was something in the invention, gave its author an introduction to the practical George Graham, who advised him, before applying to the board for assistance, to get his machine constructed. This was in 1726; but it was not till 1735 that any real success attended his efforts. A timekeeper which he then tested against the motion at sea in a river boat on the Humber answered his expectations so well that it was taken on a voyage to Lisbon, thus testing its powers of resisting both motion and temperature. The experiment was attended with most gratifying results. For this the board advanced him £500, and he was advised by them to make another, but on a smaller scale. In 1739 he appeared before the board with his second instrument; but, for some reason or other, it did not meet their approval. After the lapse of two years he was back before the board with his third timekeeper, much smaller and greatly improved, and for this he received the gold medal Royal Society. In 1758 Harrison applied to the Board of Longitude for permission to have his instrument officially tested by sending it to sea in a vessel bound for a voyage that would try its capacities in all conditions. After a considerable and quite unnecessary delay this was granted; and on November 18, 1761, William Harrison, the inventor's son, was despatched with it to Jamaica in the good ship Deptford. After being eighteen days out, the vessel, according to the then usual method of determining the longitude, was found to be 13 deg. 15 min. west of Portsmouth; while, according to Harrison's timekeeper, it was stated to be 15 deg. 19 min., a difference which the ship's navigators were not disposed to admit. Young Harrison, however, having confidence in his "watch," stoutly stood by its accuracy, and maintained that a certain island would be sighted next morning if it was properly defined on the chart. The captain, to settle the dispute, steered a course necessary to that end; and next morning, to his chagrin and Harrison's joy, the "watch" was up to time. The same results were obtained as island after island were passed; and on their arrival at Port Royal, after a voyage of over two months, the timekeeper was found to be five seconds slow; and on its return to England, after being away over five months, its error was not a minute and a quarter. Now, according to the Act of 1714, Harrison was justly entitled to the full reward of £20,000, as his instrument had defined the longitude to a point considerably less than the least distance specified by that act. But Dr. Maskelyne, who was afterward the Astronomer Royal, through some freak, would not consent to its being paid; besides, some of the other members of the board thought this astonishing accuracy was merely accidental. It was at length agreed to give an advance of £2,500; but on Harrison justly remonstrating, this sum was doubled and the balance promised when all doubts were at rest. A second voyage was then directed to be made, and on March 24, 1764, William Harrison again left the shores of his native land on board of the man-of-war Tartar, bound to Barbadoes. Every precaution was taken this time that foresight could suggest to prevent misunderstanding. The instrument was placed under three locks and keys—one being kept by Harrison, another by the captain, and the other by the navigating officer, so that, when it required winding, all three were bound to be present. On its return in September of the same year its performance was found to have quite realized the expectations of its maker. The board then paid him another five thousand pounds, withholding the balance till he had given fuller instructions to enable it to be reproduced. Larcum Kendall, who had been an apprentice of Harrison's, accomplished this; but he refused to commence without a sum of four hundred pounds being paid to him in advance. After several years of delay and many acrimonious discussions with the board, John Haraison finally, in 1767, received the balance of the £20,000. He was then in his seventy-third year. His timekeepers, which are still in existence, are the property of the Government, and are officially in charge of the Astronomer Royal in Greenwich Observatory.—*Chambers' Journal.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

November.

MEATS.—Beef, mutton, pork, venison.

POULTRY AND GAME.—Chicken, duck, geese, grouse, hare, partridge, pheasant, pigeons, rabbits, turkeys, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, whiting, salmon trout, perch, smelts, oysters.

VEGETABLES.—Artichokes, broccoli, celery, potatoes, turnips, cauliflower, cabbage, carrots.

FRUITS.—Apples, pears, quinces, grapes, nuts.

PRACTICAL RECIPES.

PEA SOUP.—Cover one quart of split or dried peas with water and let them soak overnight, in the morning drain them and put them to cook in a gallon of fresh water with six sprigs of parsley, some celery seed, cayenne pepper and salt to suit the taste. Boil until the peas are soft, then mash them through a sieve, return them to the soup, add a lump of butter and serve with dice of fried bread.

STEWED CELERY.—Cut some stalks of crisp celery into inch-length pieces, and stew them in a cup of good clear soup stock until tender, drain them out, thicken the gravy with browned flour, return the celery to it, boil up, season to taste with salt and pepper and serve.

LITTLE PIGS IN BLANKETS.—Slice some breakfast bacon so thin that it is almost transparent; select fine large oysters and wrap a piece of the bacon around each one, securing it with a wooden tooth-pick, or a small skewer. Have ready a very hot pan and fry the oysters until the bacon is brown and crisp, then serve at once.

CREOLE FISH-SAUCE.—Put in a bowl one tablespoonful Worcestershire sauce, one quarter teaspoon cayenne pepper, one large table-spoonful butter, two tomatoes, one small onion, and one table-spoonful parsley. Have the tomatoes, onions and parsley chopped very fine. Boil all these ingredients together for ten minutes, then strain. Add salt to taste.

VEAL CROQUETTES.—Boil two pounds of veal until it is very tender, then remove the bones and skin and chop the meat very fine; take half a loaf of bread and moisten it with the broth in which the veal was boiled until it is as thick as mush, stirring it over the fire; before taking from the fire add two heaping tablespoonfuls of butter and three eggs, and stir till the whole looks like thin scrambled eggs; take from the fire and put with the meat, seasoning nicely with nutmeg or mace, or a little chopped parsley, sage and thyme, and a little onion chopped and fried; salt and pepper to taste. Let this stand until cold, then form into egg-shaped pieces, dip them in beaten egg and fine bread crumbs and fry brown in very hot fat.

BAKED EGGS ON TOAST.—Break some new laid eggs onto a flat baking-dish, keeping them separate, sprinkle them with salt and pepper and pour over them a little cream; over all sift grated cheese and bread crumbs and bake. Serve in the dish in which they were baked, garnished with watercress or fresh parsley.

APPLE JELLY.—Peel, core and quarter good firm ripe apples, boil them in new cider until perfectly tender, then strain them through a sieve, being careful, however, not to press them, or the jelly will not be clear. Measure your juice, and to each pint add a pound of sugar, and boil until it jellies, which should be in twenty minutes or half an hour.

ARRANGING THE TABLE.

A LEADING AUTHORITY TELLS HOW A TABLE SHOULD BE SET.

"Learn first," says Mr. Delmonico, in an article in the November *Ladies' Home Journal*, "how to set a table." A round table is better than a square table, if the dining-room is large enough to permit it. If not, then the ordinary oblong extension table must be used. The round table is much more preferable and easier to seat people at, besides it gives a suggestion of the famous 'King Arthur and the Knights of the Round Table.' A few prominent society women still cling to the old-fashioned long, narrow table. Mrs. Astor, for example, still uses that style of dining-table in order that her famous gold dinner set may be placed to the best advantage. Mrs. August Belmont, on the contrary, prefers an oblong table, and the decorations for an elaborate dinner are carried out to make the shape more pronounced. Flowers should never be absent from the dinner-table. No matter how homely, they add to the picturesqueness of the feast. Let us see how a table is set for a fashionable dinner-party. On the table is first placed thick flannel cloth, the thicker it is the better, as it prevents noise of the dishes as they are placed on it. Over this is spread a snowy-white damask table-cloth, bearing the family crest or coat-of-arms. Sometimes over this is still placed another, of elaborate embroidery and lace, lined with pink or yellow satin, as taste dictates, or whatever color is to predominate at the dinner. The plates are first placed upon the table. As these are to remain until after soup is served, they are always the handsomest in the gold or china sets, as the case may be. Don't crowd. Each guest should be allowed a space of two feet or twenty-six inches, if the table will admit of it, and the plates placed at equal distances apart. Place dinner forks to the left of each plate; also an oyster fork, with prongs resting on the edge of the plate. On the right must be a dinner knife and a spoon for soup. The glasses are at the right of each guest on a line with the inner edge of the plate. The

water glass is set next to the plate; then glasses for whatever other beverages are intended to be served. A glass, whether of water or any other liquid, should never be filled more than three-quarters full.

BENEFICIAL FOODS.

WASTE IN THE PRODUCTION AND USE OF ANIMAL FOODS, AND ITS PREVENTION.

We condense for our readers the following from an interesting paper on the food question, by Prof. W O. Atwater, in the November *Century*: "We are better fed than the people of Europe, and do more work; but we use more food than we need. Part of the excess is simply thrown away; the rest is eaten, to the detriment of health. Our chief wastefulness is with meats and sweetmeats. People in the United States are generally able to have the kind of food they like and all they want of it. Sugar is abundant and cheap, and is consumed in immense quantities. But the worst wastefulness is in the production and use of meats. People of this country buy excessive quantities of meat, especially of fat meat. A moderate amount of meat is necessary, but the trouble is our lack of moderation. Not only is its excessive use injurious, but the waste it involves is greater than is implied in the actual cost. The chief function of meats is properly to supplement bread, potatoes, and other vegetable foods; in other words, to supply what they lack for our best nourishment. Our foods furnish us material to build up the framework of our bodies, to repair waste, to yield heat to keep us warm, and to give us muscular strength for work. Blood and muscle, bone and tendon, are made from the so-called protein compounds, such as the myosin (basis of lean meat), casein (curd) of milk, and gluten of wheat. For fuel to yield heat and muscular strength we use carbohydrates, such as starch and sugar, and fats like the oil of corn and wheat, the fat (butter) of milk, and the fat of meats. Vegetable foods, such as wheat, corn and potatoes, have relatively little protein, and their nutritive material consists mainly of carbohydrates. Beef, mutton, fish, milk, and other animal foods furnish protein in large quantities and in easily digestible forms. Best nourishment requires sufficient protein to build up our bodies and supply their wastes, as well as carbohydrates and fats for fuel. Meats and other animal foods furnish the protein in which vegetable foods are relatively deficient. Meat is a manufactured article, requiring a large amount of raw material. The making of meat is a process of transforming the vegetable protein, fats, and carbohydrates of grass and grain into the animal protein and fat of beef, pork and mutton. The same applies to milk, eggs, and other animal foods. With most economical feeding it takes many pounds of hay or corn to make a pound of beef or pork. A large amount of soil product must be consumed to produce a small amount of animal food. Hence animal foods are costlier than vegetable. This explains why in most parts of the world meat is the food of only the well-to-do, while the poor live almost entirely on vegetable food. Ordinary people in Europe eat but little meat, and in India and China none at all. Meat-making in the United States to-day is unnecessarily wasteful because of the excessive fatness of our meats. Part of the fat is trimmed off the meat by the butcher, part goes from our plates into the garbage barrel, and part is eaten. Many eat more fat, both in meat and butter, than is necessary or healthful. The agricultural production of this country to-day is one-sided. Our animal and vegetable food products, taken together, contain relatively too little of the flesh-forming ingredients—those which make muscle and tendon—and too much of those which serve as fuel. From careless culture and insufficient manuring, or other reasons, our vegetable products, and especially the grasses and grains, have come to contain smaller proportions of protein, by 25 to 40 per cent., than the same products grown in Europe. Our great staple grain, corn (maize), is poor in protein at best. This helps to explain the relative fatness of our meats. Our national dietary is likewise one-sided. Our food has too little protein and too much fat, starch and sugar. Statistics show that the quantities of fat in European dietaries range from 1 to 5 ounces per day, while in the American the range is from 4 to 16 ounces. In the daily food of professional men in Germany, who were well nourished, the quantity of fat was from 3 to 4½ ounces, while among Americans in similar conditions of life it ranged from 5 to 7½ ounces. The quantities of carbohydrates in the European dietaries were from 9 to 24 ounces, while in the corresponding American dietaries they were from 24 to 60 ounces. We eat much more meat than is necessary to supplement our vegetable food, and our meat is much fatter than is necessary. The sugary and starchy foods, of which we consume an excess, make the fat still less necessary. By the present method of meat production and use a very considerable amount of the grass and grain of farms and grazing regions is wasted, and worse than wasted. Agricultural reform will lead to the production of more and better food from less land. Dietary reform will result in the eating of less food per person, and food better adapted to the demands of health, work and purse."

ABSINTHE.

A COMPOUND WHOSE PRINCIPAL INGREDIENT IS WORMWOOD.

A writer in the San Francisco *Chronicle* says: "On my return from Switzerland I was detained a few hours at the little frontier town of Pontarlier, in the northern part of the Jura. I was told that the people of the department (Doubs), for a radius of thirty miles about Pontarlier, including necessarily a portion of Switzerland, depend almost entirely for their support on the making of cheese and the cultivation and sale of wormwood. The raising of wormwood, a bitter weed of American fields and gardens used by old women as a febrifuge and vermifuge, seems a curious industry, but all that can be produced finds a ready sale to the distillers of absinthe at Pontarlier, which is the centre of this extensive industry. Absinthe, it should be remembered, is the French for wormwood. Absinthe is made of wormwood, with the addition of other aromatic herbs that give the green color and render the taste more agreeable. When it is distilled with care (says a special plea by the distillers) and consumed in reasonable quantities it is a beverage tonic and refreshing. But too much of it should not be taken, even when it is good, for it contains a high percentage of alcohol. Many distillers simply macerate the wormwood and other herbs and steep them cold in alcohol made of beets or of grain, by which means the poisonous oils are extracted from the herbs. These poisonous qualities and the bad alcohols necessarily have a bad effect, and produce that rapid and dangerous state of intoxication that drinkers of absinthe have often noticed in regard to themselves. A beverage that operates on the nerves in such a manner as to produce instantaneous intoxication must necessarily be dangerous, first to the health, and ultimately to the reason. This effect itself shows that the liquor is of bad quality and should be condemned. A French physician says of wormwood: 'Its bitterness is its principal merit. It is tonic, stimulating, febrifuge and vermifuge. It is par excellence the herb of pale and feeble women. It is the quinine of the poor. A slight pinch is sufficient in a litre of boiling water,' etc. It is evident to the most ordinary apprehension that a liquor made from a good alcohol from an herb that has been in use the world over as a common domestic remedy, and has formed a part of the medical pharmacopœia from time immemorial, cannot be harmful if used in moderation. Two kinds of absinthe, or wormwood, are used in making the liquor at Pontarlier, the great and the small, the first for its bitter qualities, and the last, which is gathered immature, chiefly to act in giving the delicate green color. The other plants employed in the distillation are balm, caraway, anise and hyssop. Balm is classed medicinally as anti-nervous, an important antidote in a liquor considered generally as acting too forcibly on the nervous system. The qualities of caraway and anise are familiar to every one. The last is greatly used in medicine and in many other ways for its flavor and perfume. The caraway used at Pontarlier comes from the south of France, the best anise from southwestern France and from Andalusia, in Spain. The flowers of hyssop are regarded as stimulating and expectorant. All the plants used in the making of absinthe, it will be seen, have recognized medical qualities, and all, probably, as tea and coffee, a poisonous essence that should not be extracted in the process of distillation, and so become a part of the liquor. As to its history, absinthe, though it has not been fashionable till within a few years past, was invented some hundred and fifty years ago at Couvet, a little city of Switzerland, a few miles beyond Pontarlier. The inventor could never have anticipated the fame it would achieve. After having passed through various hands it was purchased by the ancestor of the present distillery of Pontarlier, to which place the industry was transferred near the close of the last century, since which epoch the use of the liquor has been gradually extending. The principal distillery of Pontarlier, which has its patent from the inventor, is an immense establishment, covering several acres, admirably appointed in every respect, kept with extraordinary neatness, and, for the convenience of transportation, connected with the railroad station, some three-quarters of a mile distant, by a track of its own. Some questions regarding the habits of the workmen were answered with a certain freedom. I desired to know how they were treated, and if from daily contact with a liquor reported so dangerous they did not acquire the habit of using it too often. My guide said that happened sometimes, but not as often as it happened in distilleries making no matter what kind of liquor. As a general thing the workmen were satisfied with the odor with which the place was impregnated, and which new-comers found somewhat intoxicating. Every employe was given a glass of absinthe every morning, with a half bottle of red wine, and they were all generally temperate and contented."

CORKS.

HOW THEY ARE MADE, AND WHAT OUT OF.

Champagne corks of the finest quality cost about a cent a piece wholesale. To the eye of the ordinary observer they do not greatly differ in quality from other corks, but, as a matter of fact, they are in a great many ways peculiar. The great champagne houses often engage the whole output of cork-cutting establishments in Spain and Portugal. These corks must be of the best bark, and the most skilful cutters are employed in their manufacture, while the same is true of all corks used with the finer wines. There has been a marked advance in the manufacture of corks within the last twenty-five years, but champagne corks are made just as they were when the first champagne was bottled. Less than a generation ago the idea of a cork-cutting machine was scouted. Now most of the corks used for ordinary purposes are made by machinery, and they are turned out by the million at such prices that the hand cork cutters of this country have been almost entirely driven out of the business. The reason for making champagne corks by hand is curious and interesting. The cork machine is provided with circular knives of razor-like edge. Now, the crude cork is so rough and hard that if it were applied to one of these rapidly

revolving knives the knife would at once be ruined; so crude cork that is to be cut by machinery must be softened in a steam vat. It comes out almost pulpy, and cuts like cheese. But the steam takes the "life" out of the cork. Its elasticity is gone, never to be recovered, and when the machine-cut cork is driven into a bottle the cork tends to shrink and permit leakage. Furthermore, the machine-made cork is mathematically round, while the necks of bottles are more or less irregular. As the machine-made cork has lost its elasticity, its smooth round surface cannot swell out to fill any irregularity in the neck of the bottle, and here is another source of leakage. The hand-made cork is quite a different affair. The crude cork to be cut by hand is first soaked in tepid water until almost ready to swell. In this condition it is taken out and turned over to the cutter. Spanish cork cutters use three knives. One is a long curved knife arranged with a gauge for regulating the size of the piece of the cork cut off. This knife is used for cutting the cork into long strips. Another and smaller knife cuts the strips up into blocks, and a third and very sharp knife is used for producing the finished cork. This knife has a blade of fine steel nearly hidden in a jacket of iron. The iron pocket is to give the knife rigidity, and the cork cutter applies not the the knife to the cork but the cork to the knife. He rests the knife on the edge of a table and presses the cork down upon the blade. The tendency of this is to curve the blade, and a curved blade would produce a hollow cork. German and American cork cutters use a thin knife, which comes from the factory straight, but is bent by the cork cutters themselves. The curved side is turned up in working, and the result is that the kink straightens under the pressure of the cork, and the latter is cut straight and not concave. The cork cutter always has a whetstone on his table and a strap upon his knee. He applies the knife to the strap after each cork is cut, and less frequently to the whetstone. Cork has a peculiar power of dulling the sharp steel with which it is cut. Hand-made corks retain their elasticity, and, not being mathematically round, they easily snug themselves into the irregularities of bottle-necks. Before being driven into a bottle of wine the cork is soaked in water, and then moistened with wine It goes in tight, absorbs some of the wine, swells, and remains swollen. When corks have been much handled in cutting they are washed clean in a weak solution of oxalic acid before being used. This country receives the best corks, as of everything else European. Thousands of men, women and children, in the mountains of Spain and Portugal, are busied in cutting cork. It is a domestic trade, and it occupies whole villages. Agents from the factories and export houses of Seville and Lisbon go through the mountain villages each year buying up the corks in enormous quantities. The agent of an importing house in this city cabled the other day that he had just returned from the Sierras after having purchased 10,000,000 corks. The corks, as purchased in the native villages, are of all sizes and qualities. They are sorted in the cities, baled in gunny cloth, paper, and gunny cloth again, and shipped to this country by the ton; once here, many of them are recut by hand at the rate of twenty gross a day. So fastidious are some bottlers that the cork importers have to keep in their employment several cork cutters to recut such corks as do not suit customers. Immense quantities of crude cork are brought into this country and cut by machinery. The crude cork varies from half an inch to two and a half inches in thickness, and it is of many qualities. The finest quality is cut up by hand into wine corks; the cheaper qualities are cut by machinery into "soda corks," cork soles, and what not. There is an enormous sale for small corks, such as are used by druggists, and tons of cork are used every year in eyeglass dips. Only the finest cork is used for this purpose, and it is difficult to obtain a proper quality. There survive in this city a few hand cork cutters who still contrive to make a sort of living in competition with the cork-cutting machines and the peasants of Catalonia. One of these men hangs out a curious sign in an east side street; it is a glass case containing the mode of a house all of cork. It is possibly the house that Jack built, for there are bits of cork to simulate bags of grain. The factory is a shed in the rear of an ordinary dwelling-house. Here, with the aid of some simple machinery, the cork cutter manages to eke out an existence. His chief grievances are the competition of machinery and the problem of disposing of the waste. Light as cork is, tons of clippings accumulate, and although various uses have been discovered for this refuse, it brings little or nothing when sold, and constantly accumulates, to the embarrassment of the cork cutter. There is a comfortable little fortune for the man who shall devise some really profitable use for cork clippings. Cork growing in Spain and Portugal is an extremely precarious business, and it demands considerable capital. Only the other day a man in this city was seeking a partner with $100,000 to put into a cork forest in Spain, with a lease of 150 years. The bark is cut only once in ten years, but as the forests are very large, the grower manages to obtain an annual crop. This year's crop is just beginning to come into the American market, the trees having been barked in July and August. Crude cork comes over in great bales weighing from 175 to 225 pounds each. The heat to which it is subjected in order to flatten out its curves also drives out most of the insects, such as one would naturally expect to find in bark. As cork is too light to form a cargo of itself, the cork-carrying vessels also bring oil, olives, wine, and heavy merchandise of various sorts.

Subscriptions $1 per year. Now is the time to subscribe.

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

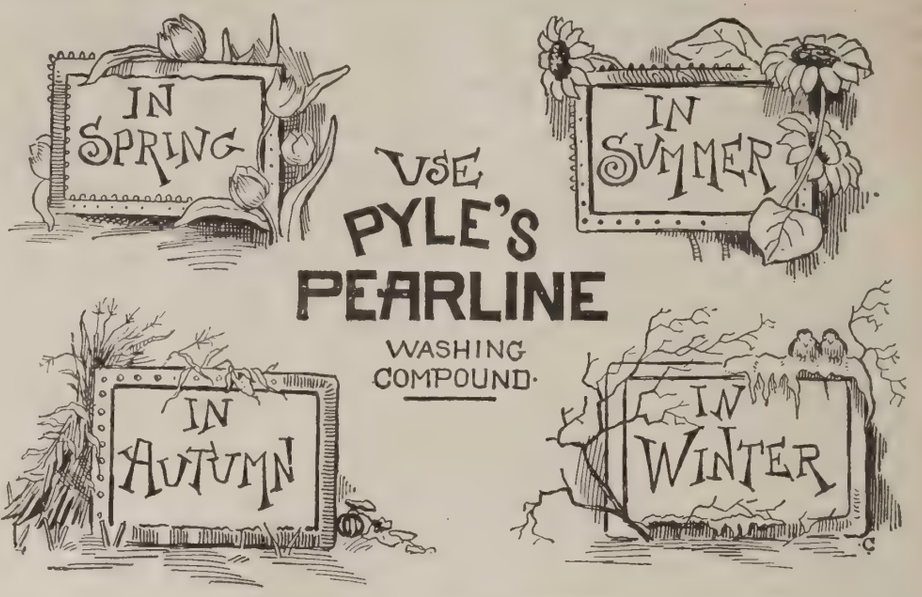
WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

BUSINESS NOTES.



A SYLLOGISM.

Teacher (to the class). "What is a syllogism?" *Pupil.* "The logical form of every argument, consisting of three propositions, namely, a major and minor premise and a conclusion. *T.* "Give an example." *P.* "Pure blood is the secret of beauty. Ayer's Sarsaparilla makes pure blood; therefore, Ayer's Sarsaparilla makes the secret of beauty." *A.* "Correct, both logically and medically."

HORSFORD'S ACID PHOSPHATE.

Recommended by physicians of all schools, for the brain, nerves and stomach.

AMPHIBIOUS BOAT.—A "locomotive steamboat" is being built in Sweden for the navigation of a chain of small lakes separated by falls. The boat is to be fitted with wheels, and power can be applied either to the propellor or to the locomotive driving wheels.

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.* 241 JAMES PYLE, New York.

FORCE OF WAVES.—Waves exert a force of one ton per square inch when they are only 20 feet high. At Cassis, France, granite blocks of 15 cubic meters have been moved by wave force.

GETTING RID of FLEAS.—A correspondent of the Washington *Star*, who has been studying the subject of getting rid of fleas, gives this as the result of his investigations: If those who are troubled with this insect will place the common adhesive fly paper on the floors of the rooms infested, with a small piece of fresh meat in the centre of each sheet, they will find that the fleas will jump toward the meat and adhere to the paper. I completely rid a badly infested house in two nights by this means.

CURIOUS CALCULATION.—A rapid penman can write 30 words in a minute. To do this he must draw his pen through the space of a rod—16½ feet. In forty minutes his pen travels a furlong, and in five hours and a third a mile. We make, on an average, 16 curves or turns of the pen for each word written. Writing 30 words in a minute, we must make 43 curves to each second; in an hour, 28,000; in five hours, 144,000; and in 300 days, working only five hours each day, we make not less than 43,200,000 curves and turn, of the pen! The man who makes but 1,000,000 strokes of the pen a month has done nothing remarkable; there are those who make four times that number. Here we have in the aggregate a mark 800 miles long, to be traced on paper by each writer in a year. In making each letter of the ordinary alphabet we make from three to seven strokes of the pen—on an average, three and a half to four.—*St. Louis Republic.*

Cleveland's is the Baking Powder used in the U. S. Army.

Happy and content is a home with "The Rochester; a lamp with the light of the morning. Catalogues, write Rochester Lamp Co., New York.

Armour's Extract of BEEF.

The best and most economical "Stock" for Soups, Etc.

One pound equals forty-five pounds of prime lean Beef.

Send to us for our book of receipts, showing use of ARMOUR'S EXTRACT in Soups and Sauces.

GOITRE, or THICK NECK.

I have a positive, speedy, cleanly, harmless and almost inexpensive cure. Come or write to me at 28 Arlington Court, CLEVELAND, Ohio. It is no iodine smear. Cure made permanent.

Dr. J. CASKEY.

Fine Table Wines

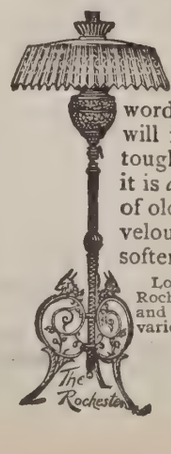
From our Celebrated Orleans Vineyard.

Arpad Haraszthy & Co.

Producers of the ECLIPSE CHAMPAGNE, 530 Washington St. SAN FRANCISCO.

GROWERS OF

Chateau d'Orleans, the highest grade Claret made in America.



Cabernet Blend, the richest and finest of Table Clarets.

O V Chablis, possessed of all the delicate pungency of its French counterpart.

O V Sauterne, with the exact character and *Seve* of imported Sauternes.

The **Chateau d'Orleans** and **O V Chablis** are sold in glass only.

"Seeing is Believing."

And a good lamp must be simple; when it is not simple it is not good. *Simple, Beautiful, Good*—these words mean much, but to see "The Rochester" will impress the truth more forcibly. All metal, tough and seamless, and made in three pieces only, it is *absolutely safe* and *unbreakable*. Like Aladdin's of old, it is indeed a "wonderful lamp," for its marvelous light is purer and brighter than gas light, softer than electric light and more cheerful than either.

Look for this stamp—THE ROCHESTER. If the lamp dealer has n't the genuine Rochester, and the style you want, send to us for our new illustrated catalogue, and we will send you a lamp safely by express—your choice of over 2,000 varieties from the *Largest Lamp Store in the World.*

ROCHESTER LAMP CO., 42 Park Place, New York City.

"The Rochester."

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

ADDRESS THE ANALYST PUBLISHING CO., 19 Park Place, New York.

A BUSINESS BENEFIT.

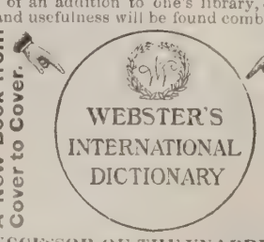
ADVANTAGES TO ADVERTISERS OFFERED BY THE "AMERICAN ANALYST."

It has not the limitations of a daily paper. No one reads yesterday's paper. A monthly lives at least a month, while a weekly is fresh four times a month, and its audience is not limited by geographical lines, but the circulation is all over the United States and Canada.

It contains matters of interest to everyone, especially the ladies of the household, and is, therefore, sure of a careful perusal. Our audiences are intelligent and of the better classes, who have money to spend, and any well worded advertisement in our columns, giving real information, will receive a careful perusal.

Our rates are as low as our circulation affords. Large circulation and original matter cost money and those advertisers who desire to realize these benefits must expect to pay reasonably for them.

Advertisements in our columns are permanent. Most of our subscribers bind their numbers.



Our advertisements are set up in an attractive form, sure to call the attention of the reader.

Anything that our readers want, or for which a demand is to be created, not wholly of a local nature, will pay to advertise with us.

We take only advertisements from legitimate houses of really meritorious goods, and give them all the editorial assistance they deserve; consequently our readers knowing this, have confidence in advertisements contained in our columns.

The fact that we have the best and largest houses in every branch of trade advertising with us, and that they always renew as their seasons arrive, proves beyond a doubt that they have found the AMERICAN ANALYST a good advertising medium. Why should not you?

AHEAD OF BELLAMY.

It is a significant token of the amazing progress of this generation that writers on scientific subjects are indulging in speculations as to what the future will bring forth to a hitherto unexampled extent. Many of these imaginative flights are fanciful, and intentionally so, but it should be borne in mind that the wildest of them are scarcely as far beyond our credence as some of the familiar scientific facts of to-day would have been to our predecessors of two generations ago. In the November *Arena* Camille Flammarion discusses, as an ultimately possible achievement, the notion of establishing communication between this planet and Mars. His theory on the subject is interesting, but the method of realizing it is suspiciously suggestive of the machinery of Locke's famous "Moon Hoax," which appeared in the *Sun* about half a century ago. The latest vision of the possible future of man is that of the famous romancer, Jules Verne, who has been speculating with pen and ink as to what will be the daily life of people 1,000 years hence. As Science extends her dominions it is noticeable how increasingly ambitious such forecasts become. Nothing will satisfy M. Verne but aerial trains travelling at the rate of 625 miles an hour, a transatlantic tubular service conveying the traveller from London to New York in 295 minutes, a "telephote" which enables friends in different hemispheres to dine with each other, or at least to see and converse with each other while eating—accumulators for condensing and radiating at will the sun's rays. Such are the advantages to be enjoyed by the inhabitants of a certain city, called "Universal City," the capital of the United States in the year of grace 2891. England by that time will, according to M. Verne, have become a province of the United States. The public will be kept informed of the latest political developments, not only upon the terrestrial globe, but upon Jupiter, Mars, and Venus; not that they will read newspapers. The newspapers of the day will be spoken. Brilliant descriptive writers will be retained to speak through the telephone to millions of subscribers, and daily instalments of novels, to be con inued to-morrow morning, will be given by popular authors. Man is to be fed on the choicest viands, laid on as New River water is at present, and it will be sufficient to step into a toilet cabinet to be tubbed, shaved, dressed and brushed in the space of two minutes. Even a new digestive apparatus, "warranted for two years," will be obtainable. But one thing we, or rather our posterity, are told not to expect—they must not expect to live forever. A certain Dr. Faithburn's experiment in freezing his own body, and causing himself to be kept for 100 years, turns out a complete failure, so obstinately does he refuse to be resuscitated.

WHY NOT WOMAN CHEFS?

One of the most surprising things about the advancement of women in the present century is that women fail to advance on certain lines on which they might be expected to. Cookery is one of these, and the fact seems to justify the assertion, so often made by gastronomers, that no woman was ever a great cook. Certainly, none is recalled who can be fairly called a famous cook. It is well worth while to consider the reason for this. The tremendous progress of the sex in so many unexpected directions within a generation renders it doubtful, to say the least, that it is because she is not capable of success. If women can equal men in the higher walks of art and science, and in many branches of literature, why can they not equal men in the kitchen? The obvious reply is that they can, but such a reply only changes the form of the question, which remains, "Then, why don't they?" To be a really great chef, one must be a scholar, an artist, a philosopher, a chemist, a physician, and a thoughtful person, and must, moreover, have at least a spark of that indefinable quality which, for lack of a better name, we call genius. But in no one of these particulars have women fallen short. It is rarely, to be sure, that a combination of all the required qualities is to be found in a woman, but so is it rarely to be found in a man. Some subtle thinkers have gone a step beyond these considerations, and have declared that the difference of sex itself is really at the bottom of the question. They say that a great cook must be thoroughly in love with his art; that women are naturally less inclined to the pleasures of the table than men are; and that consequently they cannot feel the same enthusiasm in the kitchen which men feel—not all men, to be sure, but the elect. Possibly this is the true solution. Another one suggests itself, however, which is worth considering. A vague association of ideas, ill-founded in fact, it may be, has often retarded the progress of the world, and it is not unreasonable to suggest that such an association may have deterred many women from choosing a career in which they might have excelled; for, it must be remembered, it is only a woman of the higher order who could ever excel in this line. Kitchen work, for ages, has been done, usually, by menials. This has been because the world has for ages under-rated the importance of it. Only the few have appreciated it correctly. In consequence, out of sixty millions of people, probably less than ten thousand realize the true dignity of a good cook's work. Out of that ten thousand, nine-tenths are deterred from choosing cookery for a profession by the views of people generally. Why should they devote talents that would win distinction in another pursuit, to one which is generally regarded as undignified? Well, there are two reasons why. In the first place, the general impression is a wrong one, and ought to be removed for the good of mankind; and, secondly, the emoluments are very large. An educated woman of good position is likely to think that she would lose caste by taking charge of a kitchen for pay, and perhaps she would, but so did the first woman physician lose caste. The world needs cooks more than it does physicians. Supposing women should ponder this question.

ENLIGHTENED ENTERPRISE.

We have read with interest an account published in *Electricity* of the Thomson Scientific Club of Lynn, Mass. This club, organized a year or so ago at the suggestion of Prof. Elihu Thomson, of the Thomson-Houston Company, primarily in the interests of the employes at the factory at Lynn, has already caused its influence to be felt throughout the country. The original idea, we believe, was the enlightenment and education to a higher plane, of those more immediately connected with the interests of the firm, and to this end lecturers of high repute have been invited each season to discuss, in a popular way, electrical and general scientific subjects of common interest. Prof. Thomson himself set the pace in a most admirable

READ PAGE 586.

lecture on "What is Electricity," in which he brought the information down to the latest date, illustrating in a simple and effective way the phenomena first described by Hertz, and describing many more of his own discovery. This lecture was printed in pamphlet form, and constitutes to-day the best popular exposition extant of the new direction taken in electrical research. The good that has been done could not be limited to the few for whom it was primarily intended, but has been extended to a far wider circle. So successful were the first efforts, that a new course of lectures has been announced for the coming winter, the subjects and the names of the lecturers announced guarantee that the high standard adopted in the beginning, will be maintained in the future. This interest of employer in the education of his subordinates is one of the benign results of very recent civilization. Aside from its philanthropic aspect, it is no less important from a business point of view. Experience has shown that intelligence, even in the humblest employe, has a distinct money value, and in proportion to his elevation, so will he do more and better work.

FERMENTS AND ANTI-FERMENTS.

SOME OF THE PHENOMENA OF ORGANIC LIFE.

It is one of the great discoveries of the present generation of scientists that the organic world is replete with microbes, and that all organic changes, such as growth, ripening, disease, death, and decay are the results of microbic action, partaking of the same or a similar character as the action of yeast upon wort or fermenting beer. Admitting this theory, either entirely or partly, the question naturally arises, what, then, is a microbe? And here we find ourselves in a quagmire of doubt and difficulty. If organic life is conducted by microbes, then it would not be very hazardous to suppose that organic life consists of microbes, nor should we be far wrong in the supposition if the name microbe—*micros*, small, *bios*, life—is to be accepted in its literal signification. One big life might be made up of a multitude of small life, as the jelly fish (medusa) with all its delicate tracery, colors and form, is made up of myriads of seminate jelly bodies. It is not difficult to understand that a human being, or a tree with its leaves and fruit, might be made up of microbes. If each cell of the yeast plant is a microbe, then the explanation is simple enough, and we answer the question what is a microbe? by the cell theory; and that at once would declare that, as organic life is made up of cells, it is necessarily or more probably made up of microbes. Scientific chemists have dropped the term microbe for an attempted classification into bacteria, bacilli, mycoderma, and others; but this will not screen them from the argument of logic, that if microbes are cells, and organic life is made up of cells, it follows as a matter of course that organic life is made up of microbes—is microbes in fact—which differ from each other in the formation of different tissues. Scientific chemists would laugh such a theory to scorn—but until they are able to supply one that is more rational it will be well to reserve their scorn, and open their minds to thoughtful consideration. Suppose for a time we also drop the term microbes as being too general, and take on to something more specific. What shall it be—bacilli, or mycoderms, or simple ferments, as some microbes are called? What do you make out of bacilli? The bacilli that produces abscesses are described as thread-like existences, partaking of the character of long cells. The mycoderms of mould are described in a somewhat similar manner—all being or consisting of cells—that is cell walls with some sort of contents or no contents at all. The wood of a tree, the tender shoots, the fruit with its ripening juice, the flesh, skin, and bone of man, and all other organic matter is made up of cells; so too are ferments; so too are bacilli, and mycoderms, and the bacteria, as they are called—and so too are all organic substances of any kind whatever. This has never been disputed, but philosophers have been very slow to recognize the relation that organic microbes bear to general organic existence. The chemist deals with acids and minerals, which he calls inorganic; these differing from organic substances in that they are not vitalized—that is they have no actual life. Sulphuric acid is poured upon chalk or marble, and a general activity takes place, causing effervescence, and whilst carbonic acid gas is given off, a new combination (sulphate of lime) takes place. Yeast is added to sweet wort, and carbonic acid gas is given off, and new products are evolved. Surely there is a peculiar resemblance between these two processes, which are, according to the chemist, totally dissimilar—one being organic and the other inorganic. Why—and how so? The growth of the yeast during fermentation is one indication, but the yeast grows from an act that is purely mechanical. It absorbs a portion of the sugar, and the rest becomes alcohol and carbonic acid gas. Sulphuric acid also absorbs some portion of the lime, and carbonic acid is given off, and other products are evolved. The chemist endeavors to show that there is a broad distinction between the organic and the inorganic actions; but he has signally failed to elucidate the distinction, did any exist. The organic act is merely one of taking up food and converting it to its own tissue; the organic acts of eating and digesting food, as carried on in animal life are purely chemical, and strictly in accordance with the laws of inorganic chemistry. In other words, attempts have been made to divide chemistry into organic and inorganic kinds, but the distinction is too subtle to be deciphered, and has therefore no right to exist. To this division may be traced many of the errors that chemists are making in the present day. They attempt to draw a hard-and-fast line and fail miserably, laying meshes for their own feet into which they are certain to blunder through ignorance. It has been supposed that chemistry of the present day is greatly in advance of that of half a century back. In many cases this is so, and would be in many more if young chemists were not taught the errors of their forefathers as though they were axioms or ascertained truth; and these errors they have accepted, and allowed to form the foundation or basis of all their future researches. They start, therefore, upon wrong premises; how can they be expected to arrive at just conclusions? When Pasteur startled the world with his microbic theories, chemists regarded this as a revolution in their art, and lauded Pasteur to the skies. What had Pasteur discovered beyond what existed before? He did not invent; and yet, strange to say, he has been regarded as an inventor. Microbes, or what he calls microbes, existed from the beginning of the world; ferments existed also. Pasteur and others experimented with microbes of a kind—or what they called microbes. The secret of fermentation was unravelled—it was caused by a ferment feeding. What has that to do with microbes unless ferments are to be called microbes? Yes, ferments should be called microbes, and then we shall understand that microbic action depends entirely upon the action of what is called, most erratically, inorganic chemistry. The same person could be made to believe that microbic cells, such as ferments, are able to bite out what chemical constituent they require from sugar for their food. Certainly not, the action is purely inorganic. That the ferment grows and develops is undoubtedly an organic function. But this organic function of growth and development depends entirely upon the inorganic elements contained in the ferment, and their affinity for others of the medium in which the ferment is found. Granting all this, the next question that arises is, why does the change that takes place cause the ferment to grow? And here we enter upon another phase of the subject that adds to our perplexities, although it admits of an explanation. There is a very peculiar chemical process known as osmosis, which is an exceedingly bad word for it. The notion is that animal membranes are full of holes so small that the highest power of a microscope can hardly detect them; through these holes, under certain conditions, liquid flows. Suppose we take a fresh bladder and fill it half full of brine, and plunge that into a vessel of slightly colored water, and weight it so that it must keep down under the water. In course of time the bladder will fill almost to bursting with the colored water, because, says the chemist, the brine in the bladder was of greater density, or higher specific gravity. Does that explain the reason of the change? Why should the fluid of a lesser density pass through an animal membrane to a fluid of higher density? Surely we must appeal to the force called molecular attraction, which would naturally render the attractive power of a condensed liquid stronger in proportion to its comparative density over a less dense and therefore less attractive fluid. The denser contents of the cell, therefore, would account for its filling; but why it should burst, or divide into numerous cells as it grows, is one of the mysteries of organic life that it is beyond the power of the chemist, or greatest philosopher living, to explain. Nevertheless it happens, and is sufficient evidence of the possession of a vital energy that does not exist in it after death. It is one of the great secrets of Life and Cretion; it is one of the bars drawn across the inquisitive paths of man.—*Mineral Water Trade Review, London.*

DREAMS AND SLEEP.

A SUSPENSION OF NERVOUS ACTIVITY.

Why do we sleep? What is the nature of sleep and dreams? These are questions which have excited the attention of philosophers in all ages—Aristotle at their head—without resulting in any satisfactory solution of the riddle involved in them. In recent years, investigations in the domain of physiology and psychology have thrown some light upon the subject of that condition of men and animals which we characterize as sleep; and scientific observation has, to some extent at least, cleared up the problem of dreams. There is now no doubt that what we characterize as sleep is nothing more than a suspension of the activity of the higher nerve-centres; but until recently, considerable divergence of opinion has existed as to whether, and to what extent, the somnolent state was conditioned by the flow or cessation of flow of blood to the brain. The old physiologists, and among them the famous Albrecht von Haller, taught that during sleep the blood vessels were surcharged with blood, and that sleep was induced by their pressure on the brain, a view that has still advocates, and that appears to derive a measure of support from the facts that a full stomach or a state of intoxication induces sleep. Others, and among these the no less distinguished Blumenbach, supported the exactly opposite opinion, viz., that sleep was induced by a cessation of the flow of blood to the brain, a view which was also supported by a number of facts, as, for instance, the fact that sleep is induced by loss of blood or artificial pressure upon the veins of the neck. The part played by oxygen in human and animal bodies, has a still more important bearing on the phenomena of waking and sleeping. It is now generally known that all the activities of life are maintained by a process of slow combustion. Further, it follows of course that this combustion in the organs in activity, is attended by the formation of dross and waste substances, which if they were not got rid of in some way would accumulate in the system and create considerable disturbance. Recent investigation has determined that this waste substance, this by-product of physical and mental and emotional activity, plays a very important part in relation to the changes from wakefulness to weariness and sleep—they clog the machinery of the organism. Johannes Ranke was the first to draw attention to the fact that muscular weariness is induced by the accumulation of

substances generated by muscular contraction, and especially of lactic acid. If this "tiring substance" is injected into a muscle, it deprives it of working capacity, which can only be restored by artificial washing or by giving the circulation time to perform the task. All the known conditions agree with this theory of Ranke who goes on to explain that the "tiring substance" in consequence of its innate affinity for oxygen draws it from the muscles, and thus prejudices their capacity for the performance of their active functions. There is, then, a chemical derangement of the condition of the muscles; a transitory poisoning; and some learned men have ascribed the process of respiration to the same cause. As regards this last point, Rosenthal was the first to draw attention to the fact that the succession of respiratory movements is regulated by the measure of oxygen and carbonic acid in the blood. When the blood is saturated with oxygen the activity of the nervous apparatus of breathing is temporarily contracted, but the tissues quickly take up the excess of oxygen, which they replace by carbonic acid, and the so altered blood stimulating the nervous ganglia which set the respiratory muscles in activity, induces fresh respiratory action. But while Ranke's view found general acceptance among scientific thinkers, an entirely new light was thrown on the phenomena of weariness and sleep, by the discovery in the system, by A. Gautier, of the so-called leucomaine, an alkaloid which both in its chemical constitution and in other respects, bears a great resemblance to the products of decomposition of bacteria, the ptomaines and poisonous alkaloids. According to Gautier and Errera, this substance by its chemical affinity for oxygen deoxydizes the nervous centres and thus brings about that condition of weariness which induces sleep. Further observation, moreover, points to the conclusion that this leucomaine has also a direct narcotic action on the brain, and that it induces sleep by a species of intoxication. According to Gautier it is the lecuomaine in the brain itself which contracts its working capacity, and renders a strong stimulant necessary to the maintenance of a condition of wakefulness. Our movements become slower, thought languishes until at length a moment is reached at which our dulled perceptions fail to stimulate the brain to action, and we sleep. As a rule the influence of the tiring substance on the brain is confined to those organs or cells in which it is present, and this explains the phenomena of partial sleep. Deep sleep, says Exner, is reached by imperceptible gradations from the waking stage, By watching the approach of sleep it will be found that the circle within which ideas range grows narrower and narrower. It may be concluded that certain groups of ideas remain awake after others are sunk in sleep. On the approach of death, which has been characterized as the twin sister of sleep, organ after organ ceases its activity in a prescribed order, that portion of the brain which is the seat of the highest spiritual activities dying first, and that which is the seat of lower (automatic) mental activities following later. And it is precisely so in sleep, the organs of the highest mental activity are the first to succumb. In this fact we find the explanation of somnambulism which, as the celebrated physiologist Johannes Muller has explained, is partial sleep. If we consider the possibility, that certain of the higher nerve centres which have their activity suspended on the approach of sleep, gradually pass out of this state singly or in groups and renew their activity, there is little difficulty in understanding the diversity of dreams, their want of connectedness, and even the terrible nightmare whereby, in spite of all efforts we are unable to move a limb, and have the sensation of being paralyzed. The explanation of this latter condition is that the motor nerves are still asleep while some of the nerves of thought are awake and active. The reverse of this is the case in somnambulism. Here the higher mental organs are asleep while the motor nerves are awake and capable of being set into activity by automatic nerve centres. It may be remarked as worth remembering that the generation of the waste substances herein mentioned is almost suspended during sleep.—*Dr. Moritz Alsberg.*

ARTIFICIAL COFFEE.

A FOREIGN FRAUD ADOPTED IN AMERICA.

In the last issue of the AMERICAN ANALYST was a brief editorial comment upon the traffic in fraudulent coffee. The manufacture of artificial coffee beans has, it appears, assumed some importance in this country, and we learn from the *Scientific American* that specimens of the spurious beans have been sent to Kew, England, by Dr. Brown Goode, the secretary of the Smithsonian Institution. The idea of preparing artificial coffee beans for the purpose of mixing with the genuine beans is, however, not entirely new. As long ago as 1860 coffee beans, made from finely powdered chiccory, were sent to the Kew Museums. The American beans are supposed to be composed of rye flour, glucose, and water, they are made to resemble, in size and color, a moderately good sample of roasted coffee beans, and, by the introduction of a few genuine beans, are made to possess the aroma of coffee. In the specimens we have seen the modeling is sufficiently good to deceive the ordinary public, but if the product is at all critically examined it is noticed that the groove on the flat surface is broad and shallow, and that it does not extend into the heart of the bean by a long narrow slit as in the real article, and also, that there is no trace of the silvery skin at the mouth of the slit. The introduction of spurious coffee beans as an article of commerce in the United States is described in the following article from the New York *World*: "The average bulk of the genuine coffee imported into the United States is 8,000,000 bags, or 180,000,000 pounds, per annum. Experts estimate that fully twenty per cent. of the coffee sold to consumers is bogus, which raises the consumption to 216,000,000 pounds. Taking thirty cents per pound as the average retail price, the people of America pay $65,000,000 every year for this one article of food, of which $13,000,000 is paid for roasted and ground beans, pease, rye, or a manufactured article in no way resembling the Brazillian berry. To this must be added the production and sale of what are called 'coffee substitutes.' So extensive is this business that it is quite safe to say that consumers pay $12,000,000 for what they believe to be cheap coffee. This raises the total expenditure to $77,000,000, and it represents a sale of 276,000,000 pounds, for the 'substitute coffee' usually sells at twenty cents per pound. It will thus be seen that 96,000,000 pounds of bogus coffee are sold in the United States every year, and some estimates place it at 120,000,000 pounds. Taking the lowest figures, $25,000,000 are received for substances which can be profitably placed on the market at six cents a pound. The manufacturers, therefore, receive $6,000,000 for their goods, while retailers gain a profit of $18,000,000. There are two kinds of bogus coffee, an imitation bean and the ground article. The bean is the most difficult to produce, and it is only recently that actual success in this direction has been attained. The bogus bean must not only look like the genuine berry when raw, but it should be capable of taking a proper color when roasted. A very good specimen is now manufactured in Philadelphia and Trenton, being composed of rye flour, glucose and water. The soft paste is then moulded and carefully dried. To the eye of an expert the presence of this imitation is easy of detection and it cannot be used to any great extent among wholesalers. But when coffee goes to the retailer, adulteration begins. Sometimes the retailer is deceived, but nine times out of ten he is the one who introduces adulteration. The ground article is very easily produced in the proper color, and an aroma is infused by using strong decoctions of coffee essence. When mixed with real coffee even the expert eye and tongue may be deceived, while to the ordinary consumer it seems to be the genuine product. Bogus coffee beans have only a slight resemblance to the natural berry, for though they possess the proper form, the cicatrice on the inner surface is too smooth. Then again the gray color of the raw bean is not quite up to the mark, but when these manufactured beans are roasted with five per cent. of genuine coffee they find a ready sale. These bogus beans can be made at a cost of $30 per 1,000 pounds, and when mixed with fifty pounds of pure coffee the whole 1,050 pounds cost $37.50, or 3¾ cents per pound, so that a profit of nearly 100 per cent. is the result. There are any number of 'coffee substitutes,' the Hillis variety being the most successful. This company is already manufacturing 10,000 pounds per week, it being sold by the barrel to the retailers in nearly all of the New England, Middle and Western States. The profits of this concern are supposed to be $300 per day, and its operations have reached such a scale that the stockholders were recently offered nearly $1,000,000 for their secret and business, but it was declined. No one accustomed to coffee drinking would imagine that a decoction of this stuff was like either Mocha or Rio, but when mixed with four times its bulk of genuine coffee only an expert could detect the imposition. The manufactures of these 'coffee substitutes' claim that they are not violating the law of adulteration of food products, because they do not sell their goods as coffee, but simply as a substitute. While this may be true, it does not apply to the retailer, who mixes the bogus stuff with good coffee, and sells the whole as the genuine article. Though manufacturers may be beyond the penalties of the adulteration law, they should be suppressed, for without them coffee adulteration by retailers would be impossible. When it is remembered the American people are compelled to pay $25,000,000 for ingredients that can be manufactured for one-fifth the sum received by coffee growers, the necessity for the suppression of this nefarious trade is apparent. Oleomargarine cannot be sold as butter, neither should 'coffee substitute' be made to masquerade under the name of Java, Mocha or Rio." The production of artificial coffee has also received some attention in Germany, where an imperial decree has been issued forbidding the manufacture and sale of the machines for producing the artificial beans, which certain German newspapers have recently advertised. These artificial German beans are not intended in themselves as a beverage, but are to be used in trade for mixing with the genuine article.

WORKED BOTH WAYS.—Mind-cure doctor—"Make up your mind there is no pain, and there is none. Five dollars, please." Patient (moving towards the door)—"Make up your mind there is no payin', and there is none. Good morning."—*Yankee Blade.*

NOTICE TO DRUGGISTS.—Membership in the American Pharmaceutical Association is obtained only by election at the annual meeting. "Every pharmacist and druggist of good moral and professional standing, whether in business on his own account, retired from business, or employed by another, and those teachers of pharmacy, chemistry and botany who may be especially interested in pharmacy and materia medica" are eligible for membership. For blank application and further information, address Dr. H. M. Whelpley, 2729 Washington Avenue, St. Louis, Mo., Chairman of the Committee on Membership.

FROGS AS FOOD.—Most people believe, says a daily contemporary, that the edible frog is the only eatable batrachian in Europe, and that we have not developed the taste for those creatures for the simple reason that they are rare in this country, being confined to certain localities in the Eastern Counties. This is, however, not the case. The common frog—*Rana temporaria*—is eaten on the Continent in much greater numbers than *Rana esculata;* it is just as good, and easier to catch, as well as more abundant. Something might be done in recommending this creature as food; it is common enough not to want preserving. The two frogs are so much alike that it needs a careful examination to distinguish them. In this connection we may mention that we have more than once seen frog meat on the menus of London restaurants, and remember on one occasion to have quite enjoyed frogs' legs à la poulette at Gatti's well-known Strand restaurant. The dish ate like very delicate chicken.

BRIGHT STORIES.

THE KING'S SWEETHEART.

By Conan Doyle.

To Sherlock Holmes she is always the woman. It was not that he felt any emotion akin to love for Irene Adler. All emotions, and that one particularly, were abhorrent to his cold, precise, but admirably balanced mind.

I had seen little of Holmes lately. My marriage had drifted us away from each other.

One night—it was on the 20th of March, 1888—I was returning from a journey to a patient (for I had now returned to civil practice), when my way led me through Baker Street. As I passed the well-remembered door, which must always be associated in my mind with my wooing, and with the dark incidents of the study in scarlet, I was seized with a keen desire to see Holmes again.

I rang the bell, and was shown up to the chamber which had formerly been in part my own.

His manner was not effusive. It seldom was; but he was glad, I think, to see me.

"Wedlock suits you," he remarked. "I think, Watson, that you have put on seven and one-half pounds since I saw you."

"Seven," I answered.

"I see it; I deduce it. How do I know that you have been getting yourself very wet lately, and that you have a most clumsy and careless servant girl?"

I could not help laughing at the ease with which he explained his process of deduction.

"By the way," he said, "since you are interested in these little problems, and since you are good enough to chronicle one or two of my trifling experiences, you may be interested in this."

He threw over a sheet of thick, pink-tinted note-paper which had been lying open upon the table. "It came by the last post," said he. "Read it aloud."

The note was undated and without either signature or address.

"There will call upon you to-night, at 7.45 o'clock," it said, "a gentleman who desires to consult you upon a matter of the very deepest moment. Your recent services to one of the royal houses of Europe have shown that you are one who may be safely trusted with matters which are of an importance which can hardly be exaggerated. This account of you we have from all quarters received. Be in your chamber, then, at that hour, and do not take it amiss if your visitor wears a mask."

"This is indeed a mystery," I remarked. "What do you imagine that it means?"

As I spoke there was the sharp sound of horses' hoofs and grating wheels against the curb, followed by a sharp pull at the bell. Holmes whistled.

"A pair, by the sound," said he. "Yes," he continued, glancing out of the window, "a nice little brougham and a pair of beauties. A hundred and fifty guineas a piece. There's money in this case, Watson, if there is nothing else."

"A slow and heavy step, which had been heard upon the stairs and in the passage, paused immediately outside the door. Then there was a loud and authoritative tap.

"Come in," said Holmes.

A man entered who could hardly have been less than six feet six inches in height, with the limbs and chest of a Hercules.

He carried a broad-brimmed hat in his hand, while he wore across the upper part of his face, extending down the cheek bones, a black vizard mask, which he had apparently adjusted that very moment, for his hand was still raised to it as he entered.

"You had my note?" he asked, with a deep, harsh voice and a strongly marked German accent.

"Pray, take a seat," said Holmes. "This is my friend and colleague, Dr. Watson, who is occasionally good enough to help me in my cases. Whom have I the honor to address?"

"You may address me as Count Von Kramm, a Bohemian nobleman. I understand that this gentleman, your friend, is a man of honor and discretion, whom I may trust with a matter of the most extreme importance. If not, I should much prefer to communicate with you alone."

"You may say before this gentleman anything which you may see to me."

"Then I must begin," said he, "by binding you both to absolute secrecy for two years; at the end of that time the matter will be of no importance. To speak plainly, the matter implicates the great house of Ormstein, hereditary Kings of Bohemia."

"I was also aware of that," murmured Holmes, settling himself down in his arm-chair and closing his eyes. "If your Majesty would condescend to state your case," he remarked, "I should be better able to advise you."

The man sprang from his chair and paced up and down the room in uncontrollable agitation. Then, with a gesture of desperation, he tore the mask from his face and hurled it to the ground.

"You are right," he cried; "I am the King. Why should I attempt to conceal it? I have come incognito from Prague for the purpose of consulting you."

"Then, pray consult," said Holmes, shutting his eyes once more.

"The facts are briefly these: Some five years ago, during a lengthy visit to Warsaw, I made the aquaintance of the well-known adventuress, Irene Adler. The name is, no doubt, familiar to you."

"Kindly look her up in my index, doctor," murmured Holmes, without opening his eyes For many years he had adopted a system of docketing all paragraphs concerning men and things, so that it was difficult to name a subject or person on which he could not at once furnish information.

In this case I found her biography sandwiched in between that of a Hebrew rabbi and that of a staff commander who had written a monograph upon the deep-sea fishes.

"Let me see?" said Holmes. "Hum! Born in New Jersey in the year 1858. Contralto—hum! La Saala, hum! Prima donna Imperial Opera of Warsaw—Yes! Retired from operatic stage—he! Living in London—quite so! Your Majesty, as I understand, became entangled with this young person, wrote her some compromising letters, and is now desirous of getting those letters back."

"Precisely so. But how——"

"Was there a secret marriage?"

"None."

"No legal papers or certificates?"

"None."

"Then I fail to follow your Majesty. If this young person should produce her letters, for blackmailing or other purposes, how is she to prove their authenticity?"

"There is the writing."

"Pooh, pooh! Forgery!"

"My private note-paper?"

"Stolen."

"My own seal."

"Imitated."

"My photograph."

"Bought."

"We are both in the photograph."

"Oh, dear! That is very bad! Your Majesty has indeed committed an indiscretion."

"I was mad—insane."

"You have compromised yourself seriously."

"I was only Crown Prince then. I was young. I am but thirty now, and I am about to be married."

"So I had heard."

"To Clotilde Lothman von Saxe-Meningen, second daughter of the King of Scandinavia. You may know the strict principles of her family. She is herself the very soul of delicacy. A shadow of doubt as to my conduct would bring the matter to an end."

"And Irene Adler?"

"Threatens to send them the photograph, and she will do it. I know that she will do it. You do not know her, but she has a soul of steel. She has the face of the most beautiful of women, and the mind of the most resolute of men. Rather than I should marry another woman, there are no lengths to which she would not go—none."

"And Mademoiselle's address?" he asked.

"Is Briony Lodge, Serpentine Avenue, St. John's Wood."

Holmes took a note of it. "One other question," said he. "Was the photograph a cabinet?"

"It was."

At 3 o'clock precisely I was at Baker Street, but Holmes had not yet returned. I sat down before the fire, however, with the intention of awaiting him, however long he might be.

It was close upon 4 before the door opened, and a drunken-looking groom, ill kempt and side-whiskered, with an inflamed face and disreputable clothes, walked in the room. Accustomed as I was to my friend's amazing powers in the use of disguises, I had to look three times before I was certain it was indeed he.

With a nod he vanished into the bedroom, whence he emerged in five minutes tweed-suited and respectable as of old. Putting his hand into his pockets, he stretched out his legs in front of the fire and laughed heartily for some minutes.

"I left the house a little after 8 o'clock this morning," he said, "in the character of a groom out of work. I soon found Briony Lodge.

'I lent the ostlers a hand in rubbing down their horses."

"And what of Irene Adler?" I asked.

"Oh, she has turned all the men's heads down in that part. Has only one male visitor, but a good deal of him. He is dark, handsome and dashing. Never calls less than once a day, and often twice. He is a Mr. Godfrey Norton, of the inner temple. This Godfrey Norton was evidently an important factor in the matter. He was a lawyer.

I was balancing the matter in my mind when a handsome cab drove up to Briony Lodge, and a gentleman sprang out. He was a remarkably handsome man—dark, aquiline, and mustached—evidently the man of whom I had heard. He appeared to be in a great hurry, shouted to the cabman to wait, and brushed past the maid who opened the door with the air of a man who was thoroughly at home.

"He was in the house about half an hour, and I could catch a glimpses of him in the windows of the sitting-room, pacing up and down, talking excitedly, and waving his arms.

"Of her I could see nothing. Presently he emerged, looking even more hurried than before. As he stepped up to the cab he pulled a gold watch from his pocket and looked at it earnestly.

"'Drive like the devil!' he shouted, 'first to Gross & Hankey's, in Regent Street, and then to the Church of St. Monica, in the Edgeware road. Half a guinea if you do it in 20 minutes!

"Away they went, and I was just wondering whether I should not do well to follow them, when up the lane came a neat little landau, the coachman with his coat only half buttoned, and his tie under his ear, while all the tags of his harness were sticking out of his buckles.

"It hadn't pulled up before she shot out of the hall door and into it. I only caught a glimpse of her at the moment, but she was a lovely woman, with a face that a man might die for.

"'The Church of St. Monica,' John,' she cried, 'and half a sovereign if you reach it in 20 minutes.'

(*Concluded next week.*)

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEATS.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, duck, geese, turkeys, grouse, capons, hare, partridge, pheasants, rabbits, pea-fowl, guinea-fowl, snipe, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

PRACTICAL RECIPES.

ROYAL SOUP.—Have ready a quart of clear soup. Beat two eggs with a spoon until they are well mingled, then add to them a quarter of a cup of milk and a pinch of salt. Butter a cup, pour the mixture into it, set the cup in a pan of water and bake until the egg is firm, then set it away until it is cold. Cut it up into even size bits, put them in the tureen, pour the stock boiling hot over them and serve.

BUCKWHEAT CAKES.—Put four cupfuls of buckwheat into a crock or pan and add to it half a cup of cornmeal and a teaspoonful of salt, pour in half a cup of yeast and sufficient lukewarm water to make a batter. Set to rise over night. In the morning add a tablespoonful of molasses to make them brown nicely and if too thick thin the batter with tepid water. Try the cakes and if needed add more salt.

VENISON STEAK.—Cut your steak an inch thick but no more. Put a good tablespoonful of butter in a frying pan and when it just begins to turn brown put the steak in, cover the pan while cooking and turn the steak frequently, adding salt and pepper as it cooks. Turn on a hot platter and serve very hot.

MASHED TURNIPS.—Put some firm, good white turnips that have been peeled and quartered, in cold water, and let them come to the boil, then drop them into cold water, drain and put them in enough boiling water to cover them—this takes away the rank taste—cook until they are tender enough to be rubbed through a fine sieve, return them to the fire and add three teaspoonfuls of flour, a large tablespoonful of butter, two tablespoonfuls of cream or rich milk, salt and pepper. Beat up light, let it get very hot, then dish and serve.

OYSTER OMELET.— Put a teaspoonful of flour smooth in half a teacup of cold water, then add a cup of oyster liquor, a tablespoonful of butter, half a teaspoon of salt and a pinch of pepper. Beat this mixture over the fire until it thickens, then set back where it will keep warm and add a dozen small oysters. Beat up four eggs with a tablespoonful of cream and a little salt. Pour this onto a pan containing a tablespoonful of hot oil or butter and cook until set, then pour the oyster mixture into the centre, fold over and slip onto a hot platter.

BOILED APPLE PUDDING.—Line a pudding dish with good paste. Pare, core and slice some fine apples and fill up the dish with them, sprinkling sugar, cinnamon and bits of butter among them. Put on a top crust wet and press the edges together, tie a floured cloth about the dish and cook in a pot of boiling water.

SWEET POTATO PIE.— Take four cupfuls of dry sweet potato boiled and worked through a sieve, and add to it one quart milk, four eggs, salt, nutmeg, and cinnamon, and sugar. Line a pie plate with good paste, fill with the mixture and bake without upper crust.

BALLOONS.

THEIR INCREASING USE IN MILITARY OPERATIONS.

The first flying machine we have any record of was invented by Archytas, of Tarent, a friend of Plato, in the fourth century B. C., and was in the form of a dove; but nothing further appears to have been achieved in this direction until 1768 when Besnier invented a flying machine which worked with a measure of success. Since then there has been an unbroken series of efforts to utilize balloons in war, but without any very eminent success, until during the last Franco-German war, when the French balloons played an important part in the maintenance of communications. During the four months of the siege of Paris the beleagured city sent out seventy hydrogen-filled balloons with ninety passengers, three million letters, and four hundred carrier pigeons, and of these only five balloons fell into the hands of the Germans. These results gave encouragement to France and other nations to bestir themselves earnestly for the development of aërial navigation. But before noting what the several nations have achieved in this direction, it will be in place to say a few words on the application of balloons to war purposes; and first of all we must bear in mind the distinction between the three kinds of aërial machines—the balloon attached to the earth, the free, unsteerable balloon, and the free steerable balloon; and again between the use of balloons in the field and in fortresses. The only suitable balloon for an army in the field is the captive balloon, for its serviceability depends on its availability at the required moment. While the balloon train, and the various appliances for inflating it, must be light enough to prove no serious impediment on the march, at the same time it is necessary that it can be got ready for use at short notice. Moreover the basket must not oscillate too much to admit of steady observation. The balloon need not be large—just large enough to carry a man up to five hundred metres high; but this man must be both an experienced balloonist and capable of making rapid and accurate observations, consequently an officer. The fortress balloon may be larger, and the time occupied in filling is of less importance. Its purpose is the same, viz., that of reconnoitering. The balloon should not approach within three kilometers of the enemy, or it will sooner or later be riddled. It should be secured by a copper wire to admit of telegraphing the result of observations. If the beleaguering force has surrounded the fortress, it can send a free balloon with the wind, over it, and capture it by its cavalry on the other side. The free balloon has the great advantage over the captive balloon that it is more difficult to aim at. And now as to what arrangements the leading nations have made for the utilization of balloons in future wars. France has a separate aëronautic establishment. Every French army corps has its balloon-park, and at every great drill a captive balloon takes part. The arrangements for securing the stability of the basket have been so far perfected as to admit of photographs being taken from it. The balloon is filled with hydrogen generated in the field from a prepared plastic substance called gasëin, the discovery of Major Renard. Seven pounds of this substance yield a cubic meter of gas, and Major Renard has invented a machine capable of producing 400 centimeters an hour. The balloon is made of pongee silk, varnished, and the Nordenfeld method of filling is now under test. The staff is also trained in the management of free balloons. The French have also a naval balloon service, with captive balloons, provided with electric lights, by means of which they can expose the movements of the hostile fleet without disclosing their own locality. The French have undoubtedly made greater progress in this department than any other nation. The English balloons are made of gold-beater's skin, which combines strength with lightness and imperviousness, but costs twice as much as a silk balloon. The gas is produced at central depots, compressed, and conveyed in Nordenfeld steel cylinders, which follow the balloon on wagons. Any number can be emptied into the balloon at once, and the filling occupies only a quarter of an hour. There is an aëronautic institute at Chatham similar to the French institute at Chalais-Meudon. Experiments have also been made for introducing a system of signaling by means of electric lights. The English system affords the utmost economy in transport; and, on the whole, it must be conceded that ballooning in England is on a very practical basis. The Italians, in 1885, ordered a captive balloon train from Gabriel Yon in Paris; but the Italian officers who accompanied the English expedition to the Soudan and Bechuanaland having mastered the Nordenfeld system of filling, the government decided to adopt it, and a committee of Italian officers having been deputed to visit the Chatham aëronautic institute, secured balloon material from an English house —Howard, Lane & Co., of Birmingham. These balloons have a content of only 200 cubic meters, but they suffice for reconnoitering purposes. In Russia, too, the Nordenfeld system has been recently adopted, and an aëronautic staff has been organized at St. Petersburg. Under their former system the balloons took eight hours to fill, and the necessary material weighed twenty tons, requiring twenty four-horse teams for its conveyance. These figures indicate the enormous advance in ballooning made by the introduction of the Nordenfeld system. Free balloons were used by the Russians in the manœuvres of 1886. The German aëronautic service was organized in 1887. The gas is generated on the system of Dr. Wilhelm Majert, in Berlin, and First Lieutenant G. Richter, of Falkenberg; and the filling occupies two hours. August Riedinginger of Augsburg, is building a navigable balloon, which promises to compare favorably with Renard's. The Spanish have introduced the Yon system. The balloon is ten meters in diameter and the whole material weighs eight tons. Portugal, Holland and Belgium have adopted the Lachambre system, which is very light but not very durable. Austria appointed three officers, in 1888, to study the German and English systems. A military aëronautic course exists in the institute of the editor of the Vienna *Sportzeitung*, in which six officers have made from four to eight excursions. On the whole, the Austrians are disposed to wait developments. China ordered balloons from Yon, immediately after the conclusion of peace with France, and has experimented with very satisfactory results. The materials are Chinese silk, caoutchouc, Florentine taffeta, and varnish. The contents of the balloons range from 200 to 3,000 centimeters. The United States have adopted the Yon system; and among South American States who have done something in this direction we may enumerate the Argentine Republic, Paraguay, Brazil, Chili, and Peru. The Union army used balloons in the Civil War, and the Triple Alliance used them in the war against Paraguay, 1866–67.

A. HUEBER.

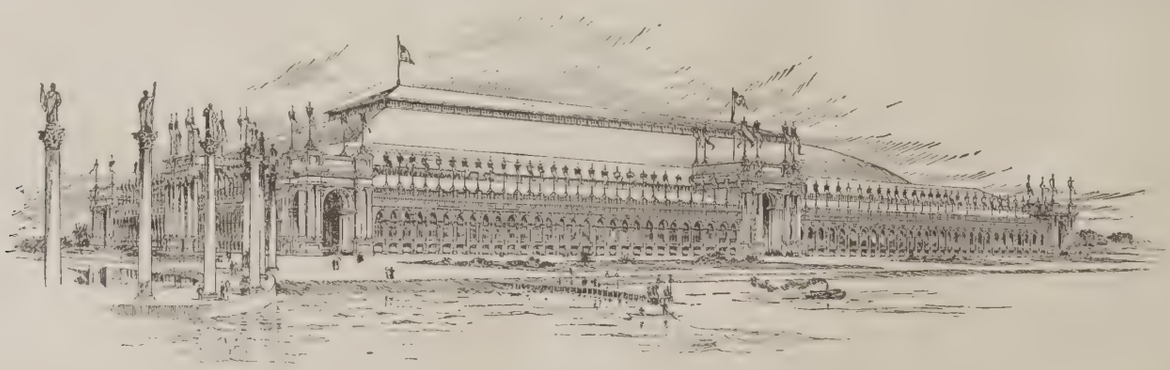
HARDENING TOOLS.—It is said that engravers in Germany harden their tools in sealing wax. The tool is heated to whiteness and plunged into the wax, withdrawn after an instant, and plunged in again, the process being repeated until the steel is too cold to enter the wax. The steel is said to become after this process almost as hard as the diamond, and when touched with a little oil of turpentine the tools are excellent for engraving and also for piercing the hardest metal.

ALPHABETS OF THE WORLD.—The Sandwich Islands alphabet has 12 letters; the Burmese 19; Italian 20; Bengalese 21; Hebrew, Syrian, Chaldee and Samaritan 22 each; French 23: Greek 24; Latin 25; German, Dutch and English 26 each; Spanish and Slavonic 27 each; Arabic 28; Persian and Coptic 32; Georgian 35; Armenian 38; Russian 41; Muscovite 43; Sanskrit and Japanese 50; Ethiopic and Tartarian have 202 each.

THE COLUMBIAN EXPOSITION.

PROGRESS OF THE WORK.

Among a great number of sketches submitted in competition for the Woman's Building by women from all over the land, the President of the Board of Lady Managers quickly discovered in the sketch submitted by Miss Sophia G. Hayden that harmony of grouping and gracefulness of details which indicate the architectural scholar, and to her was awarded the first prize of a thousand dollars, and also the execution of the design. Directly in front of the building the lagoon takes the form of a bay, about 400 feet in width.



THE WOMEN'S BUILDING.

From the center of this bay a grand landing and staircase leads to a terrace six feet above the water. Crossing this terrace other staircases give access to the ground four feet above, on which, about 100 feet back, the building is situated. The first terrace is designed in artistic flower beds and low shrubs. The principal facade has an extreme length of 400 feet, the depth of the building being half this distance. Italian renaissance is the style selected. The first story is raised about ten feet from the ground line, and a wide staircase leads to the centre pavilion. This pavilion forming the main triple-arched entrance, with an open colonnade in the second story, is finished with a low pediment enriched with a highly elaborate bas-relief.

The corner pavilions have each an open colonnade added above the main cornice. Here are located the Hanging Gardens. A lobby 40 feet wide leads into the open rotunda, 70 x 65 feet, reaching through the height of the building, and protected by a richly ornamented sky-light. This rotunda is surrounded by a two-story open arcade, as delicate and chaste in design as the exterior, the whole having a thoroughly Italian court-yard effect, admitting abundance of light to all rooms facing this interior space. On the first floor are located, on the left hand, a model hospital ; on the right, a model kindergarten ; each occupying 80 x 60 feet. The whole floor of the south pavilion is devoted to the retrospective exhibit ; the one on the north to reform work and charity organization. Each of these floors is 80 x 200 feet. The curtain opposite the main front contains the Library, Bureau of Information, records, etc. In the second story are located ladies' parlors, committee-rooms and dressing-rooms, all leading to the open balcony in front. The whole second floor of the north pavilion incloses the great assembly-room and club-room. The first of these is provided with an elevated stage for the accommodation of speakers. The south pavilion contains the model kitchen, refreshment rooms, reception rooms, etc. The building is encased with "staff," the same material used on the rest of the buildings, and as it stands with its mellow, decorated walls bathed in the bright sunshine, the women of the country are justly proud of the result.

Notable for symmetrical proportions, the Manufactures and Liberal Arts Building is the mammoth structure of the Exposition. It measures 1,687 by 787 feet and covers nearly 31 acres, being the largest Exposition building ever constructed. Within the building a gallery 50 feet wide extends around all four sides, and projecting from this are 86 smaller galleries, 12 feet wide, from which visitors may survey the vast array of exhibits and the busy scene below. The galleries are approached upon the main floor by 30 great staircases, the flights of which are 12 feet wide each. "Columbia Avenue," 50 feet wide, extends through the mammoth building longitudinally and an avenue of like width crosses it at right angles at the centre. The main roof is of iron and glass and arches an area 385 by 1,400 feet and has its ridge 150 feet from the ground. The building, including its galleries, has about 40 acres of floor space. The Manufactures and LiberalArts Building is in the Corinthian style of architecture, and in point of being severely classic excels nearly all of the other edifices. The long array of columns and arches, which its fagades present, is relieved from monotony by very elaborate ornamentation. In this ornamentation female figures, symbolical of the various arts and sciences, play a conspicuous and very attractive part. The exterior of the building is covered with "staff," which is treated to represent marble. The huge fluted columns and the immense arches are apparently of this beautiful material. There are four great entrances, one in the centre of each fagade. These are designed in the manner of triumphal arches, the central archway of each being 40 feet wide and 80 feet high. Surmounting these portals is the great attic story ornamented with sculptured eagles 18 feet high, and on each side above the side arches are great panels with inscriptions, and the spandrils are filled with sculptured figures in bas-relief. At each corner of the main building are pavilions forming great arched entrances, which are designed in harmony with the great portals. The building occupies a most conspicuous place in the grounds. It faces the lake, with only lawns and promenades between. North of it is the United States Government Building, south the Harbor and in-jutting lagoon, and west the Electrical Building and the lagoon separating it from the great island, which in part is wooded and in part resplendent with acres of bright flowers of varied hues.

MANUFACTURES AND LIBERAL ARTS BUILDING FROM THE SOUTHEAST.

EXPOSITION NOTES.

One of the unique features of the Mexican exhibit at the Fair will be the celebrated Pandure family, consisting of five persons, who are probably the most expert workers in clay and modelers of figures in the world. This family will be sent to Chicago by the State of Guadalajara. It is the intention to provide a Mexican house for them to live in during the Fair, and a workshop where their work may be inspected.

Guatemala has opened World's Columbian Exposition headquarters with an enthusiasm which assures a splendid exhibit from that country. From Guatemala newspapers it is learned that fully 100 guests, including the members of the Cabinet and other prominent officials and citizens, assembled by invitation on Saturday evening, September 12. The rooms were handsomely decorated with pictures of the Exposition buildings, lithographs furnished by the Department of Publicity and Promotion, and engravings cut from illustrated papers of the United States. There was plenty of bunting, the flags of Guatemala and the United States being intertwined. Leon Rosenthal acted as master of ceremonies. Dr. F. De Leon, the Secretary of State, made the opening speech, in which he described the magnitude and importance of the Exposition, and the advantages that could be derived from it by the Government and people of Guatemala. Dr. Guzman, the Chairman of the Board of Commissioners appointed by the Government of Guatemala to represent that republic at Chicago, responded in an appropriate manner. Lieutenant Scriven reports that the display from that country will certainly surpass expectation.

MAKING RAIN.

A SKEPTICAL VIEW OF THE IDEA.

The recently prevalent notion that rain can be produced at any time and in any place by the simple agency of atmospheric concussion is discussed in the *North American Review*, by Professor Simon Newcomb, LL.D. The following is a synopsis of his opinions on the subject: To the uncritical observer, the possible achievements of invention and discovery seem boundless. If we say that for every actual discovery there are a thousand visionary projects we are told that, after all, any given project may be the one out of the thousand. In a certain way these hopeful anticipations are justified. We cannot set any limit either to the discovery of new laws of nature or to the ingenious combination of devices to attain results which now look impossible. The science of to-day suggests a boundless field of possibilities. Such being the case, I am not going to maintain that we can never make it rain. But I do maintain two propositions. If we are going to make it rain, or produce any other result hitherto unattainable, we must employ adequate means. And if any proposed means or agency is already familiar to science, we may be able to decide beforehand whether it is adequate. Let us grant that out of a thousand seemingly visionary projects one is really sound. Must we try the entire thousand to find the one? By no means. The chances are that nine hundred of them will involve no agency that is not already fully understood, and may, therefore, be set aside without even being tried. To this class belongs the project of producing rain by sound. As I write, the daily journals are announcing the brilliant success of experiments in this direction; yet I unhesitatingly maintain that sound cannot make rain, and propose to adduce all necessary proof of my thesis. Clouds consist of impalpable particles of liquid water floating or suspended in the air. But we all know that clouds do not always fall as rain. In order that rain may fall the impalpable particles of water which form the cloud must collect into sensible drops large enough to fall to the earth. Two steps are, therefore, necessary to the formation of rain: the transparent aqueous vapor in the air must be condensed into clouds, and the material of the clouds must agglomerate into raindrops. No physical fact is better established than that, under the conditions which prevail in the atmosphere, the aqueous vapor of the air cannot be condensed into clouds except by cooling. It is true that in our laboratories it can be condensed by compression. But, for reasons which I cannot explain, condensation by compression cannot take place in the air. A current of cold air meeting a current of warm, moist air in its course may condense a considerable portion of the moisture into clouds and rain, and this condensation will go on as long as the currents continue to meet. In a hot spring day a mass of air which has been warmed by the sun, and moistened by evaporation near the surface of the earth, may rise up and cool by expansion to near the freezing point. The resulting condensation of the moisture may then produce a shower or thunder-squall. But the formation of clouds in a clear sky without motion of the air or change in the temperature of the vapor is simply impossible. Sound is one of the commonest and simplest agencies in the world for changing the state of things in the air. It is purely mechanical in its action. When a bomb explodes, a certain quantity of gas, say five or six cubic yards, is suddenly produced. It pushes aside and compresses the surrounding air in all directions, and the motion and compression are transmitted from one portion of the air to another. The amount of the motion diminishes as the square of the distance; a simple calculation shows that at a quarter of a mile from the point of explosion it would not be one-ten-thousandth of an inch. The condensation is only momentary; it may last the hundredth or the thousandth of a second, according to the suddenness and violence of the explosion; then elasticity restores the air to its original condition, and everything is just as it was before the explosion. A thousand detonations can produce no more effect upon the air, or upon the watery vapor in it, than a thousand rebounds of a small boy's rubber ball would produce upon a stone wall. So far as the compression of the air could produce even a momentary effect, it would be to prevent rather than to cause condensation of its vapor, because it is productive of heat, which produces evaporation, not condensation. The popular notion that sound may produce rain is founded principally upon the supposed fact that great battles have been followed by heavy rains. This notion, I believe, is not confirmed by statistics; but whether it is or not, we can say with confidence that it was not the sound of the cannon that produced the rain. The reader can try a very simple experiment, which ought to be conclusive. If he will explode a grain of dynamite, the concussion within a foot of the point of explosion will be greater than that which can be produced by the most powerful bomb at a distance of a quarter of a mile. In fact, if the latter can condense vapor a quarter of a mile away, then anybody can condense vapor in a room by slapping his hands. Let us, therefore, try slapping our hands, and see how long we must continue before a cloud begins to form. What we have just said applies principally to the condensation of invisible vapor. It may be asked whether, if clouds are already formed, something may not be done to accelerate their condensation into raindrops large enough to fall to the ground. This also may be the subject of experiment. Let us stand in the steam escaping from a kettle and slap our hands. We shall see whether the steam condenses into drops. It must, however, be added that the laws under which the impalpable particles of water in clouds agglomerate into drops of rain are not yet understood, and that opinions differ on this subject. Experiments to decide the question are needed, and it is to be hoped the Weather Bureau will undertake them. For anything we know to the contrary, the agglomeration may be facilitated by smoke in the air. If it be really true that rains have been produced by great battles, we may say with confidence that they were produced by the smoke from burning powder rising into the clouds and forming nuclei for the agglomeration into drops, and not by the mere explosion. How, it may be asked, shall we deal with the fact that Mr. Dyrenforth's recent explosions of bombs under a clear sky in Texas were followed in a few hours, or a day or two, by rains in a region where rain was almost unknown? But what went on during the hours that elapsed between the sound of the last bomb and the falling of the first drop of rain? Did the aqueous vapor already in the surrounding air slowly condense into clouds and raindrops in defiance of physical laws? If not, the hours must have been occupied by the passage of a mass of thousands of cubic miles of warm, moist air, coming from some other region to which the sound could not have extended. Or was Jupiter Pluvius awakened by the sound after two thousand years of slumber, and did the laws of nature become silent at his command? Investigators are generally quiet, unimpressive men, rather diffident, and wholly wanting in the art of interesting the public in their work. It is safe to say that neither Lavoisier, Galvini, Ohm, Regnault, nor Maxwell could have gotten the smallest appropriation through Congress to help make discoveries which are now the pride of our century. They all dealt in facts and conclusions quite devoid of that grandeur which renders so captivating the project of attacking the rains in their aërial stronghold with dynamite bombs.

MALARIA.

THE DISEASE ATTRIBUTED TO MICROSCOPIC PARASITES.

The Washington *Star* thinks some day a method of inoculation for the prevention of malaria may be devised. Science has got hold of the germ recently, and identified it beyond question. It is not a bacillus or any kind of bacterium, as has been imagined, but an animal parasite. The name given to it is plasmodium malariæ. It belongs to the lowest grade of animal life, being a "protozoon." This little parasite, which is of microscopic dimensions, appears to make its home ordinarily in the soil. It is plentiful in swamps, but wherever virgin ground is turned up for the first time the plasmodium is apt to be very numerously present. It has been noticed in towns that when much digging and turning over of earth has been going on, malaria exhibits a tendency to prevail. There has been a good deal of digging in Washington lately. Entering the human body through the lungs, the plasmodium seeks a roosting place in one of the red corpuscles of the blood. These corpuscles are in shape flat round disks, bearing a curious resemblance under the microscope to pieces of money. How essential their well-being is to health everybody knows. The parasite having taken up its residence in one of the corpuscles, proceeds to multiply, forming a little colony. The colony feeds upon the material of the corpuscle, which thus becomes disorganized and is finally destroyed, so that the hostile germs are set afloat in the blood. At the beginning they were merely bits of protoplasmic jelly, without any particular shape, but now they become free swimmers and have developed long hair-like oars to paddle about with. Each one has three such oars radiating from its body Thus they make their way through the veins and arteries, following the tide of the circulation. Of course, it is not possible that this sort of thing should go on to any considerable extent without seriously affecting the health of the individual. The latter is attacked by chills, alternating with fever. Quinine and other remedies destructive to the parasites relieve these symptoms. However, if the patient continues to be exposed to the absorption of the germs in a malarious region, medicines will cease to have effect. The blood, invaded by hordes of plasmodia, becomes filled with disorganized red corpuscles, and nature gives up the fight, death ensuing. Now that medical science knows precisely what it has to contend against in the treatment of this hitherto mysterious disease, it may be able to find more effective remedies. Already the discovery has enabled physicians to correctly diagnose many malarial cases which have a way of counterfeiting typhoid fever and other trouble. In such instances the presence of the plasmodia in the blood, readily ascertained by the microscope, settles the question. Besides, if one must suffer, it is a great comfort to know what is gobbling one up.

WATERING THE DECEASED.—If an Arab women who has lost her husband decides to marry again, she visits the grave of her husband the night before her second marriage, and prays him not to be offended. As, however, she feels that he will be offended, she takes with her a donkey laden with two goatskins filled with water. The prayer ended, she proceeds to pour the water on the grave, to keep the first husband cool under the circumstances, about to take place, and, having well saturated him, departs.

WOMEN'S HATS.—The French hairdressers are circulating a petition which they will submit to the minister of fine arts when it has 500,000 signatures. The purport of the document is that women be prohibited from appearing in their hats in the theatres subsidized by the Government, and that the coiffure of the ladies at such entertainments be according to the fashion devised by the Hairdressers' Association. The cause of this strange bequest is that the trade in false hair has greatly decreased for the last few years, and the present style fashion of dressing the hair in Grecian style threatens still greater in falling off in the trade.

A CHINESE MARKET GARDEN.

LONG ISLAND FARMING FOR CHINESE CONSUMPTION.

If you should go up to Chinatown almost any day now your attention would be attracted by the Chinese vegetable peddlers. Some have stands on the street, and others occupy the stoops and hallways of the Chinese tenement houses. If you are a very early bird, and get around about 7 in the morning, you will see several wagons, loaded with vegetables, and drawn by scrawny horses, come up Mott Street. The drivers are ordinary white men, but seated beside them are Chinamen. There is one Chinaman in each wagon. The arrival of these wagons is the signal for the vegetable peddlers to come down and buy. Each wagon is surrounded by them. They peer into the bags and barrels, and examine the vegetables critically. The driver sits holding the reins, while the Chinaman by his side attends to the business, exhibiting attractive specimens and rapidly figuring up the prices of vegetables selected by the peddlers. The Chinaman on the wagon has a healtheir appearance than his brethern on the sidewalk and his face is more sun-burned and yet clearer in color than theirs. The vegetables that he has for sale are odd things and the American farmer would be puzzled to find names for them. They seem to be something like the native vegetables and yet they are different. The Chinese rarely use any other. The laundrymen from all parts of this city Brooklyn, and Jersey City may be seen buying at the stands and lugging off big bags full of vegetables. The biggest dealers ship quantities to other cities, especially to Boston, Philadelphia and Pittsburg. All are raised on American soil from Chinese seeds. Over in busy Steinway is a picturesque stretch of ground covering about three and a half acres. It can be seen from the horse cars as they turn down the main road to the horse railroad depot. From there it appears to be only a lofty bit of broken ground covered with little gardens here and there. Hedges of curious vines run along one side, and poles covered with vines stand out in spots like lonely sentinels. Four ramshackle, unpainted huts peer through the vines and bushes. They have thatched roofs and look as if they might be store houses for the products of the farm. Even in Goatville the huts do not look so wretched as these; yet there is picturesqueness about them which makes even the old settlers pause as they pass by. They are the houses of the owners and workmen on the Chinese farms. There are four farms, and each is independent of the others, but no one would know it unless he enquired. For twelve years this place has been worked by Chinamen, but the original farmers long since went back to their native land, probably rich enough to buy big farms and marry and raise families. The land belongs to a resident of Steinway named Conover, and he is said to get pretty good rents from his tenants. Each farm is worked by three Chinamen. The assistants are mostly young fellows. On the day when the reporter visited the farm several men were busy in the field digging up the late vegetables. It was raining, and they wore curious hats of plaited split bamboo, which were flat on top, circular, and about twenty inches wide. One of the Chinamen was piling up a lot of vegetables near the biggest hut. Although it was a cold day he wore only a light, loose Chinese costume, and his bare feet were stuck in heelless slippers. The master was away, he said; he had gone to Chinatown to sell some produce. He was only an assistant. He could speak English only very imperfectly, but he was extremely good-natured and very different from the distrustful, evasive Chinamen in Mott Street. He tried to explain to the reporter the names and purposes of the different vegetables. A monstrous green fuzzy melon, that looked like a watermelon covered with mouldy moss, was said to be a Chinese cucumber and was called wong-wa. Some greens that resembled discarded turnip tops were, said the Chinamen, gui-tui, and the rest of the same turnips were lou-bak. Chinese celery, or something identical in appearance with the American vegetable, was bak-tui. The spinach-like greens were hong-tui, and the Chinaman said they were used for salad. The most curious of all was a long, slender melon that looked like a thin cucumber covered with spikes. This was a lak-wa. Its seeds were cut up and boiled. The hedges which lined the road on the south end of the farm bore Chinese string beans. The men working in the field were quite as frank and pleasant as the first Chinaman, but they understood even less English, and were unable to comprehend any of the reporter's questions. The reporter was struck with the regularity of the rows of plants and the apparent fertility of the soil. Water pipes had been brought in, and several Chinamen were busy drawing water and carrying it in pails to various parts of the farms. On the upper edge of the last farm the reporter met Lou We, the owner. Lou We spoke very fair English, and said that he had been farming there for several years, but had not yet been able to make it pay, "All the seeds we use," he said "come from China. We don't grow your vegetables, because Chinamen don't know how to use them. Sometimes we have seeds left over that we can use, but if the winter is cold they spoil. This has been a bad season for us. It was too dry in June, July, and August, and too wet in September. Lots of our vegetables rotted before they were ripe. The biggest of the farms is Lee Wah's. He raises more than he can sell. We were all farmers in China, and we work here as we did there." The boys and rough young men in Steinway never bother the Chinese farmers. "Ye see, its this way," said a fellow lounging about a near-by saloon, "them Chinese ain't got no fun in 'em. Ye try ter fool with 'em and they get mad right away. Every one of 'em carries a gun or a knife, so th' boys give 'em the go-by. No Chinese in ours, if ye please."—*Sun.*

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., says:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

How They Differ.

In make up: Most baking powders contain ammonia or alum. Cleveland's does not; not a particle.

It is made of pure cream of tartar and bi-carbonate of soda, with a little flour to keep the strength, nothing else. Cleveland's is wholesome.

In strength: A *rounded* spoonful of Cleveland's does better work than a *heaping* spoonful of any other.

A large saving on a year's bakings. Cleveland's leavens most.

In results: Cake made with Cleveland's is fine grained, keeps moist and fresh.

Cleveland's leavens best.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of 'Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. INSTRUCTIONS TO SUBSCRIBERS.

The **Names of all Subscribers** are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

THE ANALYST PUBLISHING CO.,
19 Park Place, New York.

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY'S SON,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

SENATOR PADDOCK'S BILL.

The pure food question after many years of agitation is at length recognized as a matter of national significance. As the readers of the AMERICAN ANALYST have been informed, Senator Paddock, of Nebraska intends to introduce in the Senate again the bill to promote purity in food products, which was before the last Congress. The bill will be referred to the Senate Committee on Agriculture, and Senator Paddock hopes to get it considered and reported in season for early consideration by the Senate. If it can be got upon the House calendar at a reasonably early date, he hopes that it may be passed through both Houses before the long session is over. In the last Congress it was late in the session before it was reported in a form entirely satisfactory to the members of the Committee on Agriculture. Meantime the House had passed the Conger Lard bill, and even if the Senate in its closing hours had substituted the Pure Food bill for the Lard bill, the House would probably have refused to concur without more time to consider the subject than was available. The chief problem in the last Congress was the constitutional one, whether Congress could interfere with the manufacture of food products in the States. The same question was discussed by the House Committee on Agriculture in the Fiftieth Congress. Both Committees reached substantially the same principle of solving the problem, although the Committee of the Fiftieth Congress did not go so far in working out the details as Senator Paddock's Committee in the last Congress. The essential principle they agreed was that the Federal Government could properly regulate commerce in the Territories and between the States, and that the standard established for inter-State commerce would soon become the standard for consumers in the States by their own demand, if not by State legislation. There is no large branch of manufacture which is not carried on for the benefit of the people of several States as well as of one State. Few manufacturers would care to limit their sales strictly to their own State for the purpose of escaping a National Pure Food bill, and the mere fact that they did so would lay their products open to suspicion. Consumers, according to the reasoning of the Committee, would come to insist that everything they purchased should bear the Federal certificate of purity, whether it happened to be manufactured in their State or not. If it were necessary, State legislatures would probably follow the model of the Federal law and a substantially uniform system be extended over all the large manufacturing States of the North. Several States already have laws to secure purity in food products. The Massachusetts law, which has been in force for some years, was generally regarded as the best model. The Senate bill had one advantage over the Conger Lard bill which passed the House. It laid no tax on harmless compounds, but simply required that they should be branded for just what they were. The Conger Lard bill was cut off the same piece of cloth as the Oleomargarine bill, and was intended to cripple an industry by taxation. It imposed a tax upon compound lard, just as the Oleomargarine bill imposed a tax on oleomargarine, with the distinct object of raising the price of the compound and relieving the producers of hog lard and butter from the competition of the manufactured product.

FEMININE PHARMACISTS.

The idea of women serving as druggists is growing in popularity in Europe. Quite recently there was placed before the Prussian Reichstag a largely signed petition in favor of admitting women to this profession. The petitioners base their demand on historic right, and recall the fact that for centuries and until the middle of the eighteenth century the preparation of medicine was almost wholly in the hands of women; that women apothecaries, who were examined by learned physicians, were given the right to prepare and sell drugs, and many of them enjoyed a high reputation in the business. The petition also claims that about the middle of the eighteenth century narrow-minded jealousies of women arose, and a desire to drive them from all lucrative handiwork to make place for men resulted in their almost absolute exclusion from this calling. They argue that the profession of the druggist demands no great bodily exertion, nor any undue publicity which should render it difficult for women or unwomanly. It is as womanly a calling as that of a teacher or saleswoman. Physicians testify, according to this petition, that "women are far superior to men in the fulfillment of all sanitary duties, in punctual obedience to a physician's orders, in dexterity and deftness." The calling of a druggist demands certain scientific study and preparation, which women have certainly shown themselves able to master. The laws in this State require this study and preparation, besides service for a term of years in a drug store and a certificate from the State Board of Pharmacy. There is no prohibition in our laws against women in this calling. In Russia, Belgium and Holland women have passed pharmaceutical examinations and devoted themselves successfully to the profession. It is at least a more independent calling than that of a nurse, which demands, in nearly every case, a great deal of individual patience, besides bodily exertion. A nurse has as much responsibility in the administration of medicine as a druggist in the preparation of it. The calling of a druggist is, moreover, one which any woman of refinement might seek.

A DELICATE MACHINE.

Information comes through a Baltimore correspondent that Prof. Henry Rowland, of the Johns Hopkins University, has just completed a scientific machine for studying the spectrum and the movements of the fixed stars, which is so delicate and fine that it can rule 1,000,000 lines to the inch. The great feature of this piece of mechanism is the screw, upon which Prof. Rowland has spent years of work and study. It is made of steel and was cut in the workshop of the physical laboratory of the Johns Hopkins. Every precaution is taken to have this the most perfect of the division engines which Prof. Rowland has devised. It is so placed that its temperature is kept nearly the same all the time, an important consideration in ruling the fine lines. The professor says that its work was not satisfactory for nearly a year because the proper oil was not used. The machine is capable of ruling 1,000,000 lines to the inch with ease, but the eye could not detect them, as even with the strongest microscope only upward of 100,000 lines to the inch can be distinguished. The largest grating made, about five inches in diameter, contains about

READ PAGE 597.

110,000 lines. Such a grating takes six days and nights' constant ruling to make. Since June the professor and his assistant, Mr. Schneider, have been trying in vain to rule a perfect one for Prof. Helmholtz, the great German physicist. Prof. Rowland has been prosecuting this great work with money obtained from the Rumford fund of the American Academy of Arts and Sciences, and from the fund given by Miss Bruce to the Harvard Astronomical Observatory for promoting research in astronomical physics.

APPLIED HYPNOTISM.

ITS POSSIBLE UTILITY AS A CURATIVE AGENT.

Dr. C. L. Tuckey, in an article on the above subject in the London *Contemporary Review* for November, expresses some interesting views of which we give the following abstract: At the present time, when even medical experts hold themselves in an attitude of indecision towards hypnotism, it is not surprising that the laity are at a loss to reconcile the conflicting opinions of the advocates of the practice and its opponents. The consideration of a few salient points may guide thoughtful persons to a correct estimation of a subject which promises to assume great importance in the near future. There are two leading theories as to the nature of hypnosis, held by the two leading schools of hypnotism. That of the Salpetriere, enunciated by the eminent physician Charcot, is that hypnotism is pathological, and, in fact, a form of hysteria, and occurs in hysterical subjects only; while the Nancy school contends that hypnosis is a physiological condition analogous to natural sleep, and that nearly all persons of sane mind can be hypnotized. It is to be regretted that Charcot and his followers, by experimenting mainly on hysterical subjects—for the most part women—have forced us to regard their experiments as incomplete, and the arguments based upon them as futile. Prof. Bernheim recently experimented on sixty-nine patients in a general hospital under his charge, and succeeded in hypnotizing the whole of them. As agricultural laborers, sailors, soldiers and the majority of children are shown to be exceptionally susceptible to hypnotism, we must, if we except Charcot's doctrine, greatly enlarge our views as to the prevalence of hysteria. The fact is, there is an extreme type of hypnotism to which only some hysterical patients are subject; but Bernheim's definition covers a much wider field. "Hypnotism," he says, "is the induction of a psychical condition, in which the subject's susceptibility to suggestion and ability to act upon it are enormously increased." It matters not whether the degree of influence produced amounts to profound sleep or merely to a slight languor; if the suggestibility of the subject is increased it constitutes hypnosis. Suggestion as to the key to the hypnotic problem. By it the subject is put to sleep or calmed into a state of receptive quiescence, and by it he is guided in the way to cure. The degree of suggestibility is not necessarily proportioned to the depth of sleep. Suggestibility, apart from hypnotism, comes within the experience of us all. Every one has some portion of such susceptibility, and in many it is highly developed and may be worked upon for good or ill with signal effect. The drunkard, converted by a Gough or a Father Mathew, is redeemed through suggestion, and through it the victim of evil example or solicitation falls to his ruin. We are physically benefited by words of hope and cheerful surroundings, and prostrated by prognostications of evil. Those ills which the hypnotist can cure by suggestion he can also frequently produce by the same method. "Hypnotism," says Prof. Delbœuf, of Liege, "by cutting off the intellectual life from the life of relation enables the highest centres to assume cognizance of and to look after the working of the organic functions." Disease, according to Liebeault, implies an excess of nervous action in one direction and its deficiency in another. Through suggestion, hypnotism enables us to restore the nervous equilibrium on which depends the maintenance of health, and the hypnotist combats disease by utilizing the patient's own forces. "The patient," says Bernheim, "hypnotizes himself." So also he cures himself through forces that are essentially his own; the direction of them only comes from without. Hypnotism does not enable us to create energies, but only to develop and control those which already exist. It cannot impart wisdom to the fool nor soundness of brain to the idiot, though it will sometimes help us to develop weak faculties and call latent powers into activity. It is for this reason that hysterical persons are by no means satisfactory patients. If we cure such persons of a pain or a malady, they are very apt to conjure it back again or to develop another in its place by morbid auto-suggestion. As it is on the physical, so it is on the psychical side. So far from an individual of weak will being the best subject for the cure of a moral infirmity—of drunkenness for example—we find it more easy to reform one of a strong character, whose natural bent is toward the right, but who has been overcome by force of circumstances, such as evil association or mental depression. The theory that hypnotism, when used in the treatment of moral cases, subverts free will, is erroneous. The originally healthy and well-disposed subject who has sunk into habits of injurious self-indulgence through temptation from surroundings, exhaustion from overwork, anxiety or some other cause outside himself, has, for the time being, lost his freedom of will; while the victim of hereditary taint or congenital deficiency, who is naturally weak or vicious, or strong only in the direction of vice, may he said never to have possessed it. To the former, hypnotic suggestion may restore his lost willpower; in the latter the treatment may possibly develop it, especially if he is young. The question of applying hypnotism to children as a means of moral reformation is a very serious one. Many people say they would rather have their children naturally bad than hypnotically good; and I confess to feeling much sympathy with this sentiment if the badness is within normal limits. But if a child is viciously inclined, absolutely unmanageable or crossly stupid, I think hypnotic suggestion might fairly be tried to reinforce other moral treatment. Already great results have been achieved, but alas! the physician must sorrowfully confess that there are many cases of drunkenness and dipsomania for which there seems no permanent cure, either by hypnotism or any other form of treatment. Before moral as before physical disease, he must too often own himself vanquished and helpless. But in a large proportion of cases hypnotism offers a good hope of cure, and we should, I think, do wrong in refusing to give it a fair trial.

FREE LUNCH.

HOW THE SALOONS OF NEW YORK ARE PROVIDED.

AN EXTENSIVE INDUSTRY WITH WHICH FEW ARE ACQUAINTED.

(*Republished by request from the* AMERICAN ANALYST *of Nov.* 12.)

A reporter of the AMERICAN ANALYST passing recently through one of the thoroughfares on the extreme western edge of the up-town business section of the city had his attention attracted by the unloading of a wagon in front of a liquor saloon. A steady procession of wagons and carts was moving in both directions, and the contiguous supply of liquor saloons was only limited by the number of aldermanic aspirants who had selected that locality as a foothold for their ambitious purposes. There was nothing phenomenal, therefore, in the mere circumstance of a vehicle disgorging its contents into a saloon, but the character of the merchandise thus transferred was what excited the reporter's curiosity. The wagon was a boxed-up affair, similar in shape to the express wagons in which our city mails are transported. Folding-doors opening at the rear displayed to view an ingenious system of boxes containing sliding trays, and these latter, as they were carefully carried into the house, were seen to be filled with a variety of toothsome eatables. One in particular bore a mammoth oval platter, on which, on a snowy napkin, a magnificent salmon, adorned with flowers, was stretched at full length in naked glory, like a nymph reposing after her bath. Others contained dishes of tempting croquettes, boned turkey, patties, salads, crisp and cool, and sandwiches enough, apparently, to supply several barge-loads of famished Fresh Air excursionists. Sardines, olives, shrimps, and a variety of condiment, on appropriate dishes, were interspersed among the more substantial viands. Our reporter, using his professional privilege, entered the establishment and was jovially welcomed in a spick and span newly equipped bar-room by the proprietor, who, bareheaded and in his shirt-sleeves, was disposing the dishes as they were brought in upon a table running across the room. It was the opening day of a new saloon, and the tempting feast that was being laid for a "free lunch" for the benefit of the public. In the short conversation that ensued, the reporter, who, of course, was a teetotaller, and wholly unused to the ways of metropolitan bar-rooms, learned to his amazement that the very handsome layout was probably only a sample of many hundreds that had been provided that day by an establishment that makes a special business of furnishing free lunches for bar-room entertainment; and that apart from the linen and china, and a few other accessories of this special occasion, the repast before him comprised only a small portion of the daily product served to saloons throughout the city. The free lunch is essentially an American institution, like the bar-room to which it pertains. Its only transatlantic prototype at the present writing is, we believe, to be found in the taproom of the Mariners' Hotel in Liverpool, where, since May of the present year, a free-to-all spread has been provided by the proprietress, Miss E. Joyce, from 11 to 1 daily. In this country it is an almost universal adjunct of the bar-room business, and in several cities, notably San Francisco and New Orleans, the gratuitous lunch that is daily set forth to attract drinking customers constitutes a repast that in elegance of preparation and variety of viands would do credit to the dining-room of the wealthiest citizen. In New York the free lunch system, if conducted on a less elaborate scale, is equally generous in its provision for the hungry multitude. If you step into any bar-room on Manhattan Island during the noontide interval of rest from work, you will find a layout of eatables of some sort, from the never failing brown bread, salted pretzel, and dried herring of the beer saloon, to the soups, fish, cold meats, sandwiches and salads which an attentive waiter stands ready to dish out for you in liberal portions in the brilliantly appointed *cafes* that decorate the more fashionable and the commercial sections of the city. A very extensive business has grown up for furnishing public houses with these free luncheons. How extensive that is may be fairly conjectured from the fact that, excluding from the computation the 3,000 German beer shops where, as already stated, the desire for the foaming tonic—no longer entirely Teutonic—is stimulated by brown bread, sour, and seasoned with cardamum seeds, and by chunks of dried salt herring, there are fully 7,000 bar-rooms in New York, almost every one of which provides its customers with a free lunch daily. Excepting a few establishments connected with hotels of the higher grade, where meals are served in restaurants "on the European plan," the surplus of which graces the bar-room on the following day, these lunches are all prepared by outside caterers, who supply their patrons daily. There are about twenty concerns of

this kind in the city, a few of which find it necessary to use a horse and wagon to make their daily deliveries—the majority, however, sending their dishes to their customers in covered trays carried by hand. The largest free lunch purveyor in the city is the one which supplied the "opening" entertainment mentioned at the beginning of this article. It is the Knickerbocker Catering Company, an incorporated Company, of which William Fowler, Jr., is President; John L. Adams, Vice-President; and Captain William Fowler, Secretary. The latter is widely known as the former genial proprietor of the Knickerbocker Cottage, in Sixth Avenue, and to-day as the Grand Panjandrum, "little top button" and all, of more social and convivial organizations in this city than any other living man ever was affiliated with at one time. The Knickerbocker Company is an institution that deserves and well repays inspecting. It began business a few years ago on a small scale, in John Street, extending gradually into larger quarters successively in West Street and Carmine Street, until in the early summer of the present year its growth necessitated the renting of the commodious quarters it now occupies at 626 Washington Street, where a four story and basement building is wholly appropriated to its use. On the ground floor are two entrances from the street, one disclosing a handsomely appointed office, the other serving as a wagon way, into which the delivery wagons are backed to receive their daily loads. The rear apartment is a large and airy kitchen, where Mr. John L. Adams, Superintendent of the *chefs*, directs his force of assistants. Three huge ovens serve for baking everything excepting bread, that commodity being furnished exclusively by the regular bakeries. In a monster cauldron, large enough to serve the purposes of an army corps, beans are boiled by the barrelful, while in another vast pot potatoes are boiled on a similar wholesale scale. When the various articles are cooked they are apportioned out in neat vessels, pans, and dishes, and are placed in compartments, each kind by itself, on shelves which line the sides of the large apartment in front of the kitchen. Here daily, in the early morning, they are loaded into the wagons for distribution among over a thousand saloons. On the second floor is, in one corner, a vast ice-house and cooling room, the rest of the apartment being appropriated to sinks and troughs, where the returned dishes are washed, and pans are scoured by a number of female employes, who likewise pare the potatoes, pick the meat from the shells and claws of lobsters, and otherwise prepare the various viands for the kitchen. The third and fourth floors are utilized for storage purposes, excepting an apartment on the latter story, which serves as a dining-room for the manager and his clerks, the meals being sent up from the kitchen in a dumb waiter. Everything in the building is neat and orderly to the senses, and eatables and utensils alike are handled with the solicitude that one fondly trusts characterizes the culinary processes in his own domestic establishment. The extent of the free lunch system in New York can in some degree be estimated from the variety of comestibles provided by this one catering company. These comprise, daily, clam chowder, clam, vegetable, and tomato soup, beef pie, veal potpie, boiled ham, baked beans, served in eight different styles, besides the toothsome Boston method, boned turkey, macaroni, bean, potato, salmon, chicken and lobster salads, fried oysters, corned beef in glorious rounds or hashed, roast beef and turkeys, boiled pig's head, baked livers, liver and bacon, sweetbreads and calves' brains, soft crabs in season, fried eels, and, on Fridays particularly, fish in variety of kinds and diversity of styles. Add to these cooked meats a great assortment of condiments and "fixings"—olives, sliced beets, pickled tripe and pigs' feet, mixed pickles, etc.—and it will be conceded that the gratuitous appeasing of the noontide appetites of the thirsty but impecunious New Yorker is an enterprise of extensive proportions. Ten wagons are required to make the daily deliveries of the Knickerbocker Company, Each driver having received and reported to the manager on the previous day the orders of his several customers, backs in his wagon to the distributing counter in rear of the office, where, by skillful system, his already selected load is speedily shipped and checked off on the shipping clerk's blotter. The ordinary dishes are set in trays that, fitting together, are piled on one another—about fifty trays constituting a wagon load. The fish and specially prepared dishes are sent out in crates with hinged lids, inside of which the platters are held by cleats. About 6 o'clock each morning, excepting Sundays, these wagons set out on their tours of distribution, and towards noon they are back again, when the drivers make returns of the day's transactions, give in their books containing the orders for the following day, and turn over the cash received for what they had just been delivering. For this is a strictly cash business—each day's order being paid for on its delivery. The 7,000 New York saloons that provide free lunches to their patrons must pay out a goodly sum of money daily to these purveyors; but as the cost of the food is more than offset by the increased trade it attracts, the expenditure does not, as one might as first imagine, react upon their customers as a tax upon drinks, to be levied by an increased dilution with Croton water. Some idea of the cost may be gained from the orders filled by one of the ten wagons on the day our reporter visited the establishment. These, representing, of course, a number of saloons, comprised 12 gallons of clam chowder, 4 of clam soup, 1 of tomato soup, 1 boiled ham, 46 pans baked beans, 25 crocks Boston baked beans, 2 crocks macaroni, 5 dishes bean salad, 20 of potato salad, 16 of salmon salad, and 1 of lobster salad, 1 gallon sliced beets, 4 pigs' heads, 40 lbs. corned beef, one plate corned beef hash, 13 platters of fish and 6 of fish hash, 200 fish balls, 72 fish cakes, 2 rounds roast beef, 16 lbs. larded liver. The entire delivery of that wagon on that Friday amounted to $70.55 in value. There are some single saloons whose daily expenditure for free lunch foots up to more than half that amount. A well-known establishment on Park Row, above the bridge, consumes each day an average of 200 loaves of bread, 150 lbs. sausage, 30 lbs. corned beef, 20 lbs. roast beef, 50 lbs. Frankfort sausages, besides a variety of smaller items, at an aggregate expense of upwards of $40 for every noontide repast. The average cost, however, to well patronized saloons in business thoroughfares, where every other passer-by is not in search or in need of a free meal, may be put at from $6 to $12 per day. It is accordingly within reasonable limits to estimate the daily expenditure in New York for free lunches at $50,000; a statement that will at first stagger the reader's belief, but one that will, as the above figures indicate, challenge acceptance on investigation. Extend the computation to cover all the cities in the country, and the free lunch business will be found to represent an enormous annual expenditure.

SULPHUR.

ITS OCCURRENCE AND CHEMICAL CHARACTER.

One of the important elements used in the arts and in manufactures is sulphur. It is a comparatively abundant substance, wide-spread, and was known to the ancients by the name of brimstone. Being an active chemical element, it is found in numerous combinations with other elements, and also in the free state. Most of the free sulphur used in commerce comes from Sicily, but it is also found in Iceland, Mexico and South America in the free state, and always in the vicinity of volcanoes. When found in this state it is mixed with earth, from which it has to be separated. The separation is carried on by heat, which melts the sulphur, leaving the earth. The earth is first put into an iron pot and heated; the sulphur melts and is taken out and put into cold water, where it solidifies. The remaining earth contains a little sulphur, which is obtained by distillation. It is placed in earthern pots in a furnace and the sulphur melts. The pots are so arranged that they connect with other pots outside the furnace, which act as condensers, and into which the melted sulphur flows. There is an opening at the bottom of the condensers through which the sulphur flows out into the water, where it becomes solid. The sulphur is now in the rough or crude state, and must be purified. The process is carried on in a large brick furnace. The sulphur is put into an iron pot at some distance from the fire, where it melts and runs down through a pipe into another pot nearer the fire; here it boils and is vaporized. The vapor passes into a large brick chamber, upon the walls of which it condenses in the form of minute crystals. When in this state it is known as flowers of sulphur. Gradually the walls become hot and the sulphur melts, flowing down to the floor. At the bottom of the chamber there is an exit, through which the melted sulphur flows out into wooden moulds, in which it receives the form of a stick or roll. When sulphur is found in combination with other elements it is separated by different means. Considerable quantities of it are obtained in England from iron and copper pyrites. In this process a quantity of brush wood is spread upon the ground or upon a layer of broken pyrites. On this brush is placed about two thousand tons of ore, a space being left for a flue. The pile is fired by dropping lighted brands into the flue, and, as it burns, the sulphur melts and runs out, collecting in cavities. About twenty tons of sulphur are usually obtained from such a pile. Sulphur [S, II, IV, VI, $_{32}$] is a light yellow, solid, brittle substance with a vitreous lustre, and breaking with a concoidal fracture. It has a hardness of about 2½, is very inflammable, burning with a blue flame, and is insoluble in water. When rubbed with hair or wool it becomes negatively electrified, but is a bad conductor of electricity. It melts at 116 deg., forming an amber-colored liquid. If heated above 120 deg. the liquid turns dark and grows thick. As the temperature rises the liquid grows thicker and its color deepens, until at 200 deg.-250 deg. it is nearly black, and so thick that the dish containing it may be inverted and none of the paste will run out. Then it begins to grow thin as the heat increases, forming a brown gas at 440 deg., the boiling point. Sulphur may occur in three allotropic forms, which are distinguished by their crystalline forms and solubility in carbon bi-sulphide. The ordinary form is the rhombic, which may be got by evaporating carbon bi-sulphide in which sulphur is dissolved. The crystals are in the form of rhombic octahedrons, yellow and glassy. The second kind takes the form of oblique prismatic, slender, needle-like crystals, which are made by melting sulphur and allowing it to cool, so that a surface crust is formed. The crust is broken and the liquid beneath poured off, leaving transparent crystals. These are not permanent, but in a few hours grow dull and fall into minute rhombic forms. The third form is black sulphur, which is made by pouring liquid sulphur at about 280 deg. into cold water. A soft, gummy mass is formed, which may be drawn into strings. These grow darker as the temperature is raised. When left to themselves they change in a short time to the rhombic form, becoming yellow, opaque and brittle. Hence, the only permanent form is the rhombic. Sulphur combines with numerous other elements. With hydrogen it forms sulphretted hydrogen; with oxygen, sulphur dioxide and sulphuric anhydride; with carbon, carbon bi-sulphide. It is also found in minerals, where it forms sulphides and sulphates. In manufacturing it is used extensively in matches, gunpowder, sulphuric acid and other things.—*Popular Science News.*

BRIGHT STORIES.

THE KING'S SWEETHEART.

By Conan Doyle.

(*Concluded from page* 580.)

"This was quite too good to lose, Watson. I was just balancing whether I should run for it, or whether I should perch behind her landau, when a cab came through the streets. The driver looked twice at such a shabby fare, but I jumped in before he could object.

"'The Church of St. Monica,' said I, 'and half a sovereign if you reach it in 20 minutes.' It was 25 minutes to 12, and of course it was clear enough what was in the wind.

"My cabby drove fast. I don't think I ever drove faster, but the others were there before us. The cab and the landau, with their steaming horses, were in front of the door when I arrived. I paid the man and hurried into the church.

"There was not a soul there save the two whom I had followed and a surpliced clergyman, who seemed to be expostulating with them. They were all three standing in a knot in front of the altar. I lounged up the side aisle like any other idler who has dropped into a church.

"Suddenly, to my surprise, the three at the altar faced round to me, and Godfrey Norton came running as hard as he could towards me.

"'Thank God!' he cried. 'You'll do. 'Come! Come!'

"'What then?' I asked.

"Come, man, come; only three minutes or it won't be legal."

"I was half dragged up to the altar, and before I knew where I was I found myself mumbling responses which were whispered in my ear and vouching for things of which I knew nothing, and generally assisting in the secure tying up of Irene Adler, spinster, to Godfrey Norton, bachelor.

"It was all done in an instant, and there was the gentleman thanking me on the one side and the lady on the other, while the clergyman beamed on me in front. It was the most preposterous position in which I ever found myself in my life, and it was the thought of it that started me laughing just now.

"It seems that there had been some informality about their license, that the clergymen absolutely refused to marry them without a witness of some sort, and that my lucky appearance saved the bridegroom from having to sally out into the streets in search of a best man. The bride gave me a sovereign, and I mean to wear it on my watch chain in memory of the occasion.

"At the church door they separated, he driving back to the Temple and she to her own house. 'I shall drive out in the park at five, as usual,' she said, as she left him. I heard no more.

"They drove away in different directions, and I went off to make my own arrangements."

"Now," he said, "Miss Irene, or Madame, rather, returns from her drive at seven. We must be at Briony Lodge to meet her."

"And what then?"

"You must leave that to me."

He disappeared into his bedroom, and returned in a few minutes in the character of an amiable and simple-hearted Noncomformist clergyman.

It was 6.15 when I left Baker Street, and it still wanted ten minutes to the hour when we found ourselves in Serpentine Avenue.

It was already dusk, and the lamps were just being lighted as we paced up and down in front of Briony Lodge, waiting for the coming of its occupant.

Soon the gleam of the side-lights of a carriage came around the curve of the avenue. It was a smart little landau which rattled up to the door of Briony Lodge.

As it pulled up one of the loafing men at the corner dashed forward to open the door in the hope of earning a copper, but was elbowed away by another loafer, who had rushed up with the same intention.

A fierce quarrel broke out, which was increased by the two guardsmen, who took sides with one of the loungers, and by the scissors-grinder, who was equally hot upon the other side.

A blow was struck, and in an instant the lady, who had stepped from her carriage, was the centre of a little knot of flushed and struggling men who struck savagely at each other with their fists and sticks.

Holmes dashed into the crowd to protect the lady, but just as he reached her he gave a cry and dropped to the ground, with the blood running freely down his face.

At this the guardsmen took to their heels in one direction and the loungers in the other, while a number of better dressed people, who had watched the scuffle without taking part in it, crowded in to help the lady and to attend to the injured man.

Irene Adler, as I will still call her, had hurried up the steps; but she stood at the top with her superb figure outlined against the lights of the hall, looking back into the street.

"Is the poor gentleman much hurt?" she asked.

"He is dead," cried several voices.

"No, no, there's life in him," shouted another. "But he'll be gone before you can get him to a hospital."

"He's a brave fellow," said a woman. "They would have had the lady's purse and watch if it hadn't been for him. They were a gang, and a rough one, too. Ah! he's breathing now."

"He can't lie in the street. May we bring him in, marm?"

"Surely. Bring him into the sitting-room. There is a comfortable sofa there. This way, please."

Slowly and solemnly he was borne into Briony Lodge, and laid out in the principal room, while I observed the proceedings from my post by the window.

I took a smoke-rocket from under my ulster.

Holmes had sat up upon the couch, and I saw him motion like a man who is in need of air. A maid rushed across and threw open the window. At the same instant I saw him raise his hand, and at the signal I tossed my rocket into the room with a cry of "Fire."

The word was no sooner out of my mouth than the whole crowd of spectators, well-dressed and ill—gentlemen, ostlers and servant maids—joined in a general shriek of "Fire."

Thick clouds of smoke curled through the room and out at the open window. I caught a glimpse of rushing figures, and a moment later the voice of Holmes from within, assuring them that it was a false alarm.

Slipping through the shouting crowd I made my way to the corner of the street and in ten minutes was rejoiced to find my friend's arm in mine and to get away from the scene of uproar.

He walked swiftly and in silence for some few minutes, until we had turned down one of the quiet streets which leads toward the Edgeware road.

"You did it very nicely, doctor," he remarked. "Nothing could have been better. It is all right."

"You have the photograph?"

"I know where it is."

"And how did you find out?"

"She showed me, as I told you that she would."

"You of course saw that every one in the street was an accomplice. They were all engaged for the evening."

"I guessed as much."

"Then when the row broke out I had a little moist red paint in the palm of my hand. I rushed forward, fell down, clapped my hand to my face and became a piteous spectacle. It is an old trick."

"That also I could fathom."

"Then they carried me in. She was bound to have me in. What else could she do? And into her sitting room, which was the very room which I suspected. It lay between that and her bed room, and I was determined to see which. They laid me on a couch. I motioned for air, they were compelled to open the window, and you had your chance.

"When a women thinks that her house is on fire, her instinct is at once to rush to the thing which she values most.

"Irene responded beautifully. The photograph is in a recess behind a sliding panel just above the right bell pull. She was there in an instant, and I caught a glimpse of it as she half drew it out. When I cried out that it was a false alarm, she replaced it, glanced at the rocket, rushed from the room, and I have not seen her since.

"I rose, and making my excuse, escaped from the house. I hesitated whether to attempt to secure the photograph at once; but the coachman had come in, and, as he was watching me narrowly, it seemed safer to wait. A little over-precipitance may ruin all, and it might be a satisfaction to His Majesty to regain it with his own hands."

We had reached Baker Street and had stopped at the door. He was searching his pockets for the key, when some one passing said:

"Good-night, Mr. Sherlock Holmes."

"I've heard that voice before," said Holmes, staring down the dimly-lit street. "Now I wonder who the deuce that could have been."

* * * * * * * * *

I slept at Baker Street that night, and we were engaged upon our toast and coffee in the morning when the King of Bohemia rushed into the room.

"You have really got it!" he cried, grasping Sherlock Holmes by either shoulder, and looking eagerly into his face.

"Not yet."

"But you have hopes?"

"I have hopes."

"Then come. I am all impatience to be gone."

"We must have a cab."

"No, my brougham is waiting."

"Then that will simplify matters."

We descended, and started off once more for Briony Lodge.

"Irene Adler is married," remarked Holmes.

"Married! When?"

"Yesterday."

He relapsed into a moody silence, which was not broken until we drew up in Serpentine Avenue.

The door of Briony Lodge was open, and an elderly woman stood upon the steps.

She watched us with a sardonic eye, as we stepped from the brougham.

"Mr. Sherlock Holmes, I believe," said she.

"I am Mr. Holmes," answered my companion, looking at her with a questioning and rather startled gaze.

"Indeed! My mistress told me that you were likely to call. She left this morning with her husband by the 5:15 train from Charing Cross for the continent."

"What!" Sherlock Holmes staggered back, white with chagrin and surprise. "Do you mean that she has left England?"

"Never to return."

"And the papers?" asked the King, hoarsely. "All is lost."

"We shall see." Holmes pushed past the servant and rushed into the drawing room, followed by the King and myself.

Holmes rushed at the bell-pull, tore back a small sliding shutter, and plunging in his hand, pulled out a photograph and a letter.

The photograph was of Irene Adler herself in evening dress, the letter was superscribed to "Sherlock Holmes, Esq. To be left till called for."

My friend tore it open, and we all three read it together. It was dated at midnight of the previous night, and ran in this way:

My Dear Mr. Sherlock Holmes: You really did it very well. You took me in completely. Until after the alarm of fire, I had not a suspicion. But then, when I found how I had betrayed myself, I began to think. I had been warned against you months ago. I had been told that if the king employed an agent, it would certainly be you. And your address had been given me. Yet, with all this, you made me reveal what you wanted to know.

Even after I became suspicious, I found it hard to think evil of such a dear kind, old clergyman. But, you know, I have been trained as an actress myself. Male costume is nothing new to me.

I often take advantage of the freedom which it gives. I sent John, the coachman, to watch you, ran up stairs, got into my walking clothes, as I call them, and came down just as you departed.

Well, I followed you to your door, and so made sure that I was really an object of interest to the celebrated Mr. Sherlock Holmes. Then I, rather imprudently wished you good night, and started for the Temple to see my husband.

We both thought the best resource was flight, when pursued by so formidable an antagonist; so you will find the nest empty when you call to-morrow. As to the photograph, your client may rest in peace. I love and am loved by a better man than he.

The king may do what he will without hindrance from one whom he has cruelly wronged.

I keep it only to safeguard myself, and to preserve a weapon which will always secure me from any steps which he might take in the future. I leave a photograph which he might care to possess; and I remain, dear Mr. Sherlock Holmes, very truly yours,

IRENE NORTON, NE ADLER.

"I am sorry," said Holmes, "that I have been unable to bring Your Majesty's business to a more successful conclusion."

"On the contrary, my dear sir," cried the King, "nothing can be more successful. I know that her word is inviolate. The photograph is now as safe as if it were in the fire."

"I am glad to hear Your Majesty say so."

"I am immensely indebted to you. Pray tell me in what way I can reward you. This ring—" He slipped an emerald snake ring from his finger, and held it out upon the palm of his hand.

"Your Majesty has something which I should value even more highly," said Holmes.

"You have but to name it."

"This photograph!"

The King started at him in amazement.

"Irene's photograph!" he cried. "Certainly, if you wish it."

"I thank Your Majesty. Then there is no more to be done in this matter. I have the honor to wish you a very good morning."

"OLD PROBABILITIES."

HOW THE WEATHER PREDICTIONS ARE MADE.

"My office is the highest in the country, not excepting President Harrison's." Sergeant Frankenfield, of the signal service, was referring to the location of his den on the seventeenth floor of the Auditorium building and meant no disrespect to the chief magistracy. He was comfortably ensconced in an easy office chair studying the weather chart just issued and meditating as to whether he would give Chicago snow or pleasant weather. "So you want an insight into the mysteries of my weather-guessing methods. Well, I will show you," said he, "how we do it, and then I think that it will appear like very simple work. In the first place let me get my keys and we will go up and take a look at the instruments." Out on the roof of the tower he went, then up a winding stairway to the roof of the shelter house. Here are the wind vane and the anemometers. The latter are instruments for measuring the velocity of the wind and have four arms revolving horizontally, at the end of each of which is a hemispherical hollow cup of iron to catch the breeze. Ordinarily only one of these anemometers is in use, but they are changed every month and before taking down the one that has been in use in order to clean it, the pair are run side by side for twenty-four hours as a test of correctness. Both the vane and anemometer are connected by electric wires with registers in the office below. These show the direction of the wind every five minutes and also mark every mile it travels. On the roof of the tower is a covered table surrounded by fixed blinds to protect the instruments from the rain, and here are kept the thermometers, of which there are four, all of the highest grade. The simplest are the ordinary self-registering maximum and minimum thermometers. The other two are delicate Richard alcoholic registering instruments. One of these registers on a paper-covered cylinder in the same case, while the other is connected by wire with a register in the office below. The remaining instrument in this stand is a hygrometer for ascertaining the amount of humidity in the atmosphere. This consists of two thermometers side by side in a frame, the bulb of one of them being covered with cotton. When an observation is to be taken the cotton is saturated with water and the frame is rapidly revolved. The evaporation of the water lowers the mercury in the wet bulb, and from the difference between the two readings is obtained the percentage of moisture and the temperature at which dew would fall, or, as it is termed the dew point. In one corner of the tower stand the rain and snow gauges. These are tall, galvanized iron buckets about eight inches in diameter and twenty-four inches in height. In the bottom of the bucket is a well of small diameter, so that a slight fall of rain will show in the well ten times as great a depth as in the main receptacle. In this well is a float, whose rising turns a wheel connected by wires with a register on which a stroke is made whenever 2-100ths of an inch of water is caught. One inch of melted snow is considered equal to ten inches of the freshly fallen flakes. All the instruments on the roof having been examined, the sergeant leads the way back to the office. Here are the registers which print the records on which the benefits to be derived from the service depend. In a little mahogony and glass case is a cylinder, 4 inches in diameter and 6 inches in length, covered with paper which is ruled with parallel lines. At the side of this cylinder and almost touching it are three arms, the tips of which are provided with pencils or pens. These arms are connected with the vane by wires, anemometer and rain gauge, and the cylinder, which is actuated by clock-work, is made to revolve every six hours. The first arm is over four parallel columns headed N. E. S. W., and every five minutes is pressed to the face of the cylinder. If the wind is due north a stroke is made in the N. column; if northeast, a stroke is made in both the N. and E. columns. The second arm connected with the anemometer is forced against the paper whenever that instrument shows that a mile of wind has passed and makes a short mark lengthwise on the cylinder. The third arm is connected with the rain guage and makes a stroke whenever 2-100ths of an inch of rain falls. Thus on this one sheet of paper is recorded the direction and strength of the wind and the amount of rainfall for twelve hours, and the paper being ruled off for five minute periods, the observer can tell at a glance almost the precise moment at which any change took place. On another stand is the register connected with the thermometer on the roof, and it works on the same principle as the one just described. By its side is the delicate aneroid barometer, also connected with its register. With these three records at hand the observer could after a laps of years describe accurately the meteorological condition of any desired day. "Now," said the sergeant, "you have seen how our observations are taken, and twice every day, at 7 A. M. and 7 P.M., similar observations are taken at the 182 stations of the department. Each of these stations are on some circuit of the Western Union telegraph lines, and shortly after the hours for taking the observations a line is cleared for transmitting the reports. Take for example the circuit on the Atlantic coast from Jacksonville, Fla., to Eastport, Me. At 7.30 A. M. the line is free and Jacksonville sends her report. This is taken down at every other station, and then Charleston sends hers and so on up the line until when Eastport has sent hers every station on the circuit has the entire list. At certain points these circuits cross and information is exchanged, so that in a very few moments each office is in the possession of a full report from all over the country. When these reports are all in the office we proceed to make use of them. We have maps already prepared showing all the principle stations in the Uuited States and also exchange stations in British America. At each of these points we draw small circles, which show the state of the sky, being covered with straight lines if cloudy, half covered if fair and blank if clear. A letter 'R' in the circle means rain. With an arrow we mark the direction of the wind. To the right of the circle we set down the height of the barometer, then the temperature and lastly the velocity of the wind. Then we proceed to make what my little 3-year-old boy calls fish worms. Taking a blue pencil we start from Eastport, Me., where the barometer reading is, for example, 29.9 inches, and we draw a continuous line through each place at which the air pressure is the same. This may take us through Albany, Cleveland, Kansas City, Salt Lake and north into British America. This line is called an isobar, or line of equal pressure. When we have drawn these lines for each one-tenth of an inch difference in pressure we usually find that the line of lowest pressure forms an irregular oval, and this oval is a well defined storm center. We also note that the general direction of the wind is toward this centre and away from the center of high barometer. The velocity of the wind will enable us to judge very closely the speed with which this storm center will move during the coming twelve or twenty-four hours and also the direction it will probably take. Next, with a red pencil we draw lines through the stations reporting the same temperature, and these lines we call isotherms. They divide the map into irregular figures, shaped much like dissected picture puzzels or clouds on a summer day. These sections show an average difference in temperature of ten degrees, and if the direction of the wind and its velocity show that one of these clouds, with a temperature of 40 degrees, will be swept over a station, where the thermometer now marks 50 degrees we know that it is safe to predict cooler weather. Lastly we compare the figures of this report with those of the previous one and note the difference in the temperatures and in the dew points. If the latter difference is greater than the former it indicates rain, and on the contrary if it is less we are safe in predicting clear weather. When the entire country is quiet we can usually predict with accuracy the weather for forty-eight hours, but under ordinary circumstances we do not care to risk our reputations on anything more than twenty-four hours distant. We are now issuing about forty copies of weather charts for public information, but we propose after Jan. 1st to distribute about 400. They will be sent to postmasters and others in the neighboring towns, where they can be posted for the benefit of the public. A great many people are interested in the study of the weather, there being over 2,200 stations in the United States where observations are regularly taken by volunteer observers, and the number is continually on the increase."—*Chicago Mercantile Journal.*

SEASONABLE CAUTION.—None but the brave attend the church fair.—*Elmira Gazette.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEATS.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, duck, geese, turkeys, grouse, capons, hare, partridge, pheasants, rabbits, pea-fowls, guinea-fowl, snipe, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

PRACTICAL RECIPES.

ROAST CHICKEN.—Clean your chickens and singe them; prepare a stuffing of bread crumbs, seasoned with sage, thyme, salt, pepper, chopped onion and melted butter; wet it with a little milk and stuff your chickens; sew them up, and tie the wings and legs close to the body. Rub them all over with salt. Take a lump of soft butter in your hand and rub them over with it. Dredge them thoroughly with flour, and put them in a quick oven to brown; then pour enough water into the pan to cover the bottom, and baste them every fifteen minutes until done. Add more water as it boils away, keeping, however, only enough in the pan to cover the bottom. Turn the chickens so that they shall be evenly browned all over. Allow an hour and a half for a pair of good-sized chickens.

OYSTERS IN BEEF GRAVY.—Put in a saucepan a good tablespoonful of clear beef dripping or butter, a small bit of bay leaf, a tablespoonful of minced onion, and a scant teaspoonful of salt. Cook until the onion browns; then add two cupfuls of beef broth and two and a half teaspoonfuls browned flour. Simmer until it thickens, then strain and add a dozen oysters. Serve on thin slices of nicely browned toast.

CREAM PIES.—Boil two cupfuls of milk with two or three bitter almonds, a stick of cinnamon, a piece of lemon peel, and seven or eight lumps of sugar, until the flavors are extracted; then strain and stir until cool; beat up the yolks of six eggs and mix well with the milk; stir the whole over a slow fire until it is like cream, flavor with almond or rose water, and bake in a deep pie plate with a lower crust only.

MINCE MEAT.—Boil a fresh beef tongue and chop it very fine; add to this two pounds suet, finely chopped, four pounds stoned raisins, two pounds Sultana raisins, three pounds currants, washed and dried, two pounds white sugar, one pint brandy, one bottle wine, nutmeg and cinnamon to taste, and a little allspice. Add apples the day you bake, about half as many, chopped very fine, as you use mince meat. Line the dish with light paste, fill with the mince meat, cover with a crust, and bake in a moderate oven. The ingredients of the mince meat should be thoroughly mixed together and kept in a covered jar.

PICKLED LEMONS.—Wash and wipe six large lemons; put with them one pound salt, six large cloves of garlic, two ounces horseradish, sliced thin, one-half ounce cloves, mace, nutmeg and cayenne pepper, two ounces mustard, two quarts of vinegar. Boil all together for fifteen minutes, then pour into a jar, and stir daily for six weeks. Keep the jar closely covered.

SPONGE CAKE.—Whites fourteen eggs, yolks seven eggs, ten ounces flour, one pound sugar; flavor with grated lemon peel.

YEAST POWDER.—Mix thoroughly one pound soda with two pounds cream of tartar. Use one teaspoonful of this mixture to a pint of flour, sifting it with the flour.

ELECTROLYSIS.

HOW SUPERFLUOUS HAIR IS REMOVED BY ELECTRICITY.

The following is the text of a paper read by Dr. P. S. Hayes at a recent meeting of the American Electro-Therapeutical Association: The removal of superfluous hairs by means of electrolysis was primarily devised as a purely therapeutic measure. It was only after this method had been demonstrated to be a perfect success in the destruction of hairs in entropium that this procedure was diverted from its strictly therapeutic channel and applied to a broader field, and used in what may be called a cosmetic, rather than a therapeutic, sense. Even if confined to the cosmetic use, there is a decided therapeutic effect produced in the liberation of many ladies from a self-imposed seclusion, if not actual close confinement, akin to prison life. The gloom produced from this seclusion has frequently made life a burden, and been a factor of no small moment in the development of a melancholia. A correspondent writes that he understands that this operation is largely a mechanical one, and he desires instruction enough to know how, and then he will be able to do as well as anyone. This latter statement he does not make, but from the tenor of his letter is readily inferred. The operation is mechanical, much in the same sense that the repairing of a watch is mechanical; but it is not every watchmaker, to say nothing of the broad class of mechanics, to whom we would intrust our valuable watches. Those who first demonstrated the possibility of the permanent removal of superfluous hair by means of electrolysis did their work so thoroughly and understood the laws of electrolysis so well, that but little has been added to the technique of the operation during the past six years. Whether the operation is for therapeutic or cosmetic purposes, two points are to be kept constantly in the mind, namely, to destroy the hair and then see to it that you do not leave indelible proof in scars that you have not done your work thoroughly. The statement is frequently made that this operation leaves no scars. The frequent occurrence of scars in positions that tell of the destruction of offending hairs, as well as the form of the scar left, gives the lie to the statement. If this were not sufficient, then the application that we have for the removal or modification of scars, or the completion of the work that some one else has commenced, but by reason of clumsiness has made the patient seek some more skilful operator, will leave no doubt in the minds of all that scars may result. Without entering into the detail of the operation so well understood, I will take up the points that have aided me most in making the operation a perfect success, and leaving little to be desired, unless it be that the time consumed in its performance may be abridged.

The history of the changes and modifications in the needle has shown that we did not have all that was to be desired in this important part of our apparatus. Theoretically the needle should be so constructed that it will reach the bottom of the hair follicle and come in contact with the papilla without doing violence to the tissues, and, finally, to be so arranged that the current will exert its electrolytic effects only at the point of contact with the papilla. Practically this is impossible of accomplishment: but in this direction much more has been accomplished than would at first sight seem possible. I early discovered that a blunt-pointed needle was much better than a sharp one, and a thin one than a thick one. After a long series of experiments I came to the conclusion that steel was the only material that would give us a needle of sufficient tenuity, and yet have the strength and rigidity to accomplish the desired result. The best material for the needle is found in the jewelers' broach, an instrument for reaming out the jewels in watches. This is ground to (so as to be of) a diameter varying from $\frac{1}{200}$ to $\frac{3}{200}$ of an inch. From the point to a space of one-sixteenth of an inch back it should be slightly thicker than the shaft; although this bulbous joint is of advantage, it is not an absolute necessity. The point of the needle is the main thing, and it should represent as nearly as possible a hemisphere. A conical point should never be used because of the danger of piercing the walls of the hair follicle. The temper of the jewelers' broach of necessity renders the steel exceeding brittle, and it has been found of advantage to draw the temper in order to prevent breakage of the needle. This is best accomplished by taking a glass tube of about one-fourth inch in diameter and closing one end, and introducing the needle into the closed tube. This is then held in the flame of an alcohol lamp or Bunsen burner until the tube begins to become slightly red, when it is put aside to cool with the needle in it. When cold the needle will be found to have had its temper drawn so that it can be bent at right angles and straightened again without breaking. It is still quite rigid enough for our purpose. Should the attempt be made to heat needles as thin as those described in the naked flame they will take fire and burn, thus completely destroying their usefulness. I present for your consideration, to illustrate these facts, some needles prepared as I have directed and furnished by the McIntosh Battery and Optical Company, of Chicago. It has been with great difficulty that I have been enabled to have the needles manufactured of the diameter given in this paper. While the shape was easily obtained and the finish of the needle all that could be desired, the size was almost, without exception, from three to five times too great. Before using a needle I invariably examine it with a lens of three-fourths inch focus in order to see that the point is the proper shape. If the shape is not as it should be, another needle is selected. My experience has been that I could ill afford to work with a needle that was not as it should be. I have found that a needle bent at an angle varying from 45 to 90 degrees, from two to three-eighths of an inch from its point, serves my purpose better than a straight one. All things considered, we accomplish our best results with the thinnest needle. (Those who have once used a needle prepared in the manner described, and as exemplified by the samples shown, will never use any other form of needle.)

The strength of current required (for this operation) varies from three-fourths of a milliampere to a milliampere and one-half, and, in rare instances, possibly, three milliamperes. The strength of the current, however, must, of necessity, be regulated by the amount of chemical action which takes place around the needle, as well as by the amount of pain produced. In this operation the chemical action produced around the needle (the negative electrode) is a much better index than the milliammeter. In fact, the milliammeter is all but a useless instrument in electrolytic epilation. As a rule, the less current the longer the time required to destroy the tissue, including the hair papilla. From three to six cells of the diamond carbon battery is usually sufficient. The question has been frequently asked whether storage cells could be used. The reply is, that if three or four storage cells are connected in series for tension, the current obtained from such a battery can be used. The resistance of the tissues, of the thin steel needle, of the ordinary electrode and of the cords, is so great that our milliammeter will register no greater strength of current than as though we had used the same number of Bunsen cells. The commercial current from an Edison plant has been successfully used. The pain produced is ordinarily so great as to make its use undesirable. The Edison current has an ordinary pressure of about 110 volts. To reduce this current so that we can use it for epilation, we find that the difficulty to be overcome is that, with our present means of controlling the current, we reduce the amperage much faster than we do the voltage, and, consequently, get a current of tension which is more painful than current obtained from a battery. The results of a number of observations have led me

to formulate the following: Have as little resistance in the circuit outside of the battery as possible. A battery with large cells and large elements is preferable to one with small elements. Two cells of a storage or galvano-cautery battery are equal to about three cells of a diamond carbon battery. Where the external resistance is as great as it is in this operation it will be found that the milliammeter will register about one milliampere for three diamond carbon or two storage or galvano-cautery cells. It is thus readily seen that the current from the storage or cautery battery has been so reduced by the resistance of the body and the circuit, in which it is included, as to be unable to heat the needle at all. We must count the volts rather than the amperes. In the above statements, relative to the requisite number of cells of the various batteries required, it will be found that the volts in two cautery cells will equal the number in three diamond carbon cells.

I desire to emphasize but one or two facts, rather than to give any detailed account of the operation. Always use care in introducing the needle, and see that it follows the hair closely. Do not carry the current so long as to produce a lesion that will form a scar on healing. If the needle is arrested before it has entered much beyond the neck of the follicle, by reason of the size and density of the hair and root sheaths, allow the current to pass until any adhesions that may exist at the point are overcome. It would be well, in this case, to cause the needle to act on the tissues on all sides of the hair. Remove the hair and the root sheaths will come with it, if the operation has been carefully done. The re-introduction of the needle in the now empty follicle is easily accomplished, and, if care is used, the papilla will be reached without trouble, and destroyed with more certainty and less destruction of tissue than as though this method had not been followed. This method is only to be used in those cases where the needle does not follow the hair to the papilla when first introduced. The re introduction of the needle insures the destruction of a much greater percentage of hairs than where this is not done.

We can state that but little that is new has been added to our methods in electrolytic epilation during the past few years. The advance in this branch has been brought about by improving the apparatus at hand, rather than by the introduction of new apparatus. In the needle we note the exceeding thinness of it, the hemispherical and bulbous shape of the point, and the drawing of the temper. In the battery, that cells with comparatively large amperage (large surface of plates) are of advantage. In the circuit, outside of the battery, that the conductors shall offer but little resistance; the connections be good; the positive electrode large, and that every piece of apparatus, such as a rheostat and milliammeter, that would interpose resistance, be left out of the circuit. In the operation, that it is advisable in many instances to remove the hair before the needle has reached, and the current has destroyed, the papilla, and then reintroduce the needle, which now readily glides into the follicle made vacant by the hair and its root sheath. With the most approved apparatus the ultimate success depends as much upon the man as the means. Every operator leaves his record on the face of his subjects, and success or failure, as well as gratitude or regret (according to the result), is accorded to him who essays this simple yet delicate operation.

AROMA OF WINE.—At a recent meeting of the Paris Academy of Sciences, M. Rommier read a paper on the yeast of wine—the bouquet, or aroma, of the wine made from grapes of the same species but grown in different districts being quiet distant. The characteristic bouquet seems to be due to the district, and wine from shifted vines or cuttings does not neccessarily possess the special flavor of the original when planted in other districts. It is well known that the best wines are produced from grapes raised on volcanic soils.

ELECTRIC CLOCK.

SOMETHING UNIQUE IN THE WAY OF A TIMEPIECE.

The first tower clock actuated by electricity in the United States has just been put in successful operation in the new court house in Los Angeles, Cal. This pioneer timepiece, that is commonly termed "the big clock," might be called a botanical parlance a composite, for it is in reality four clocks, as each dial in the tower is supplied with its own separate apparatus, operated by wires from the main battery, There are also sixteen smaller clocks located in various parts of the magnificient new building, and these twenty clocks beat time together without ticking but with instantaneous precision. The regulator which does the timekeeping is a large eight-day clock that differs from an ordinary regulator only in being provided with two insulated wires, and when its second hand completes its round it comes in contact with a platinum point, which instantaneous touch makes a momentary electric circuit by means of the wires, the flash communicating with all the other clocks, and each obeys the telegraphic mandate by pointing a new minute. The source of the electricity for all this automatic whispering is found in batteries that are located in one of the tower rooms, where two separate installations, each containing 211 cells, are in a cabinet together. Only one of the two sets is, however, required at a time—the other is simply for use in case of an emergency, and it is but the work of an instant to connect the whole apparatus with the unused battery by simply turning the handle of a compound switch.

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

The clocks need not lose a minute in the change, for the switching can be accomplished between the electric flashes. Among the interesting parts of the ingenious mechanism is a relay through which all the electric currents pass. This relay has at one end an armature and magnet similar to, but larger than, those seen in a common telegraphic sounder. The lever of the magnet works a shaft that causes 18 brass fingers to vibrate. When the fingers fall they complete the electric current in eighteen wires that run to the 20 dials—connection being as simultaneously broken when the fingers are raised. Ocular proof of the presence of electricity is given in green sparks on the tips of the brass points when the connection is broken. Many persons climb the extra flight of stairs above the battery room and only pause in the section of the tower where the four great dials are placed. The gigantic hands of rolled steel each weigh 40 pounds and are to be seen dimly through the translucent glass of the dials that are about 16 feet in diameter. The shaft that carries the hands pierces the center of the disk where it is connected with a large armature with an attachment of brass cogwheels. Each flash over the wires leading from the battery room whirls through the big spool of wire in the armature, magnetizes the soft iron core and shield, swings a ratchet lever, gives a turn to the brass cogwheels and thus causes the minute hand outside to swing along nearly ten inches. We go down to the outside world 200 feet below, and when we turn to look up once more at the minute hand we understand that its seeming short steps each announce that down in the heart of the great building the tiny, trembling second hand of the regulator has just completed another delicate cycle and marked the flight of another minute.

There is no place like home

—when *Pearline* is used in it. There is no place about home where *Pearline* can't be used.

Pearline takes the hard work and drudgery out of —keeping a home clean.

It is next to having the washing and cleaning done for you, and well done at that.

It washes everything that can be washed. It cleans paint, marble, carpets, hangings—in fact everything cleanable.

It is a luxury in the bath. It is emphatically without harm to person or things. With *Pearline* you have rest; it rests with you to have *Pearline*.

Your Home is probably invaded by peddlers, who claim the stuff they offer is Pearline, "the same as" Pearline, or "as good as" Pearline. IT'S FALSE—Pearline has no equal, and is never peddled. 238 JAMES PYLE, New York.

The four
Official Reports,

U. S. Govern't, Bulletin No. 10; Canadian Gov't, Bulletin No. 13; Ohio Food Commission, and N. J. Food Commission, show

Cleveland's Baking Powder

strongest of all

pure cream of tartar powders, yielding (average) 12.87 per cent. carbonic acid gas.

The Scientific American, after a most careful examination of the Official Reports, says: "The showing Cleveland's makes, compared with all the principal brands, is such as to put it emphatically at the head."

Happy and content is a home with "The Rochester; a lamp with the light of the morning. Catalogues, write Rochester Lamp Co., New York.

Armour's

Extract of BEEF.

The best and most economical "Stock" for Soups, Etc.

One pound equals forty-five pounds of prime lean Beef.

Send to us for our book of receipts, showing use of **ARMOUR'S EXTRACT** in Soups and Sauces.

ARMOUR & CO., Chicago.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

Imparts renewed strength and vigor where there has been exhaustion. Dr. C. R. Dake, Belleville, Ill., says: "I have found it, and it alone, to be capable of producing a sweet and natural sleep in cases or insomnia from overwork of the brain, which so often occurs in active professional and business men."

PAINTED PAPER.—Unsized paper is coated with an aqueous solution of dextrine. When this coat is dry a layer of siccative oil paint is applied; and the sheet so obtained may be used for packing purposes, to render fabrics impermeable to water, etc.

The Old Doctor's Book of Secrets.

Tells everything! Over 400 pages, closely printed, with illustrations. Contains medical receipts and prescriptions, and much valuable information all young men should know. Sent securely wrapped in plain wrapper, postage prepaid, to any address for $1.00.

(Send for it. One receipt alone may save you many times its cost

ECLIPSE

CHAMPAGNE,

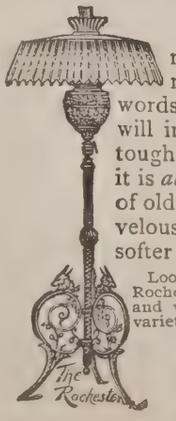
530 Washington St.

SAN FRANCISCO.

Arpad Haraszthy & Co

GROWERS OF

Chateau d'Orleans, the highest grade Claret made in America.



Cabernet Blend, the richest and finest of Table Clarets.

O V Chablis, possessed of all the delicate pungency of its French counterpart.

O V Sauterne, with the exact character and *Seve* of imported Sauternes.

The **Chateau d'Orleans** and **O V Chablis** are sold in glass only.

"Seeing is Believing."

And a good lamp must be simple; when it is not simple it is not good. *Simple, Beautiful, Good*—these words mean much, but to see "The Rochester" will impress the truth more forcibly. All metal, tough and seamless, and made in three pieces only, it is *absolutely safe* and *unbreakable*. Like Aladdin's of old, it is indeed a "wonderful lamp," for its marvelous light is purer and brighter than gas light, softer than electric light and more cheerful than either.

Look for this stamp—THE ROCHESTER. If the lamp dealer has n't the **genuine** Rochester, and the style you want, send to us for our new illustrated catalogue, and we will send you a lamp safely by express—your choice of over **2,000** varieties from the *Largest Lamp Store in the World.*

ROCHESTER LAMP CO., 42 Park Place, New York City.

"The Rochester."

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you (making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

FOR THE SPEEDY RELIEF OF

NERVOUS HEADACHE AND BRAIN FATIGUE.

WARNER & CO.'S EFFERVESCING

Useful in Nervous Headache, Sleeplessness, Excessive Study, Over Brainwork, Nervous Debility, Mania, etc.

DOSE.—A heaping teaspoonful in half a glass of water, to be repeated once after an interval of thirty minutes, if necessary. Each teaspoonful contains 30 grs. Bromide Sodium and 1 gr. Caffein.

It is claimed by some prominent specialists in nervous diseases that the Sodium Salt is more acceptable to the stomach than the Bromide Potassium. An almost certain relief is given by the administration of this Effervescing Salt. It is also used with advantage in INDIGESTION, DEPRESSION following alcoholic and other excesses, as well as NERVOUS HEADACHE. It affords speedy relief for MENTAL and PHYSICAL EXHAUSTION.

ENGLISH RAILROAD LIGHTS.

Whatever there is of comfort and satisfaction in railway travel is, like most other manifestations of modern progress, due to American inventive genius. On the other side of the Atlantic the old system of compartment carriages is adhered to, with little deviation, and the best of them are inferior in comfort and conveniences to the commonest of the parlor, boudoir, buffet or sleeping coaches, such as are found on nearly every passenger train in the United States. It is interesting to note the satisfaction with which the introduction of a plan for even the partial illumination of cars in England is greeted as a desirable novelty. We read in *Electricity* a description of an electric light scheme, operated on the "penny-in-the-slot" principle which has recently been placed in passenger carriages on some of the English railways. In Great Britain it is not an unusual sight to see the fortunate passengers by express trains who have secured corner seats, reading their books and papers by the light of a wax candle precariously secured to the window sill by some of his own wax. Railway lamps, on the principle of a small carriage lamp, with a pointed hook for attachment to the cloth lining of the car, are purchasable at most railway book stalls in England, and generally form part of the belongings of experienced travelers in that country. Mr. W. H. Preece, the well-known English electrician, has, our contemporary says, improved on the wax candle and the railway lamp. For quite a number of years he has carried with him a compact electric lighting outfit, consisting of a pocket accumulator and a small incandescent lamp enclosed in a miniature bull's-eye lantern. Comfortably settled in his seat he attaches the lantern to the top button-hole of his coat, turns on the current and obtains a perfect light on his papers, much to the wonder and envy of his less fortunate fellow passengers. The "penny-in-the-slot" electric railway light comes then as a boon and a blessing to travelers in the old country. Every one who has suffered from the intense aggravation of trying to read by a dim light can appreciate the ease and contentment which it affords to those who make use of it. The lamps are placed in convenient positions to throw a good light on the book or paper; to the side of the car is attached a box containing the accumulator and mechanism for switching the current on and off. By dropping a penny into the slot the light is set going for fifteen minutes, at the end of which time the circuit is automatically opened and the light extinguished. Eight cents an hour is rather a dear price to pay for light, but not everybody wants to read all the time while traveling, and if one wants to read very badly then the necessary light is cheap at any price.

ELECTRICITY AT CHICAGO.

The significance of the electrical feature to be displayed at the Columbian Exposition in Chicago, in 1893, is attracting extensive attention from the newspapers. The *Mail and Express* recently commenting on the transmission of electrical power 105 miles, from Lauffen to Frankfort, said that the day might not be so far distant as many supposed when the force of Niagara Falls would be employed to generate electrical power which would be conveyed and utilized over a vast area. Now we hear that it is proposed to drive the electrical exhibit at the World's Fair by electricity generated at Niagara. The distance is 475 miles. The scheme does not seem impracticable, in view of the Frankfort experiment. The idea is a grand one, and, if carried out, would do much to place the fair in the front rank of world expositions. The subject is further amplified by the *Electrical Review*, which predicts that electricity will be the feature of greatest interest and importance at the World's Columbian Exposition. The recent experiments in electric power transmission at the Frankfort Electrical Exhibition were entirely successful. It is but a question of detail to increase the distance over which power may be carried. From Lauffen to Frankfort is 108 miles. From Niagara Falls to Chicago is about 475 miles. Large turbines and generators at Niagara, a carefully protected and well insulated line of heavy copper, and a motor plant at Jackson Park, will do the business. Of course this project needs much money and careful engineering to bring it to full success. Inestimable benefit would accrue to electrical interests as a result of such a demonstration. As regards electric lighting, development in that line is so constant that it is well nigh impossible to predict what may be the state of the art when the World's Fair opens. We may see a building illuminated by glow lamps without circuit wires, after the plans of Mr. Nikola Tesla. Electric traction will probably be well nigh perfect by the end of 1892. Many bright minds are puzzling over the storage battery problem: it is an enigma which may be practically solved at any hour. The recent production by the Thomson-Houston Electric Company of an electric locomotive capable of drawing nine loaded freight cars is, indeed, an advance. It is undoubtedly the forerunner of an electric machine which may displace the steam locomotive. The underground conduit system of electric street railway propulsion is also in the field for future recognition. Visitors to the World's Fair will see applications of electric power for manufacturing purposes which will be truly astonishing. Our predictions are not the vagaries of a phantom prophet, but are beliefs founded firmly and solidly upon an abiding faith in that mysterious agent whose manifestations are so wonderful, and about which we have learned so much and know so little.

EXPLOSIVE STOVE POLISH.

In these days of dynamite bombs we find that equally serious dangers threaten our households, for some unscrupulous manufacturers, with only an eye to money making, have put upon the market a liquid stove polish which, being largely composed of benzine, petroleum, naphtha or wood alcohol, is said to evaporate rapidly, and leave the base of plumbago on the stove in such a finely divided filament as to produce a shining surface. To gain this questionable advantage over the old-fashioned dry stove polishes, tidy but unthinking housewives are induced to purchase and use these exceedingly dangerous liquid polishes. The following account of a shocking accident, which we take from a daily paper, serves as an impressive illustration: Mrs. Willett Marsh, wife of an artist of that name, living at No. 59 West Front Street, Plainfield, N. J., was disfigured for life by an explosion of stove polish to-day. She was polishing a stove with a patent liquid polish containing some volatile ingredient, when suddenly it exploded and the blazing liquid was scattered about the room. Mrs. Marsh's clothing was set afire, and in an instant she was enveloped in flames. Fortunately help was at hand, and the flames were extinguished as quickly as possible. At first it was feared that she was

READ PAGE 610.

fatally injured, but it is now thought her life can be saved. She will probably lose both hands, and her body will be terribly scarred.

THE FOOD EXPOSITION.

On the afternoon of Saturday, December 5th, the Food Manufacturers' Association held the first of their monthly press receptions at the Madison Square Garden. The object of the meeting was to bring before the press, and through it the public, the coming Food Exposition, and the benefits to accrue to the city therewith. The Association, which numbers among its members companies and dealers from Boston, Rochester, Chicago, New Orleans, New Haven, Pittsburg, Willmington, Philadelphia, Dover, Cincinnati, Providence and other cities, proposes holding in October, 1892, an exhibition to promote the manufacture, sale and consumption of wholesome food products, to establish close, cordial, and confidential relations between the manufacturer, distributor, and consumer, and to enlighten and educate the public as to the importance of using the best quality of food. It is not intended to establish a food inspection or analysis, but simply to stimulate the production of higher grades of food products by appeals to the public whom they consider the best judge and jury in such matters. Although the exhibition will not be held for a year, space has already been allotted to forty-seven leading firms, and the success of the fair is a foregone conclusion. The officers are: E. C. Hazard, President; Read Gordon, First Vice-President; Alphonse Biardot, Second Vice-President; W. G. Dean, Treasurer; Daniel Browne, Secretary. The Board of Directors comprise: E. C. Hazard (E. C. Hazard & Co.), Read Gordon (Gordon & Dilworth), Alphonse Biardot (Franco-American Food Co.), Geo. P. Tangeman (Cleveland Baking Powder Co.), B. J. Shafer (Joseph Burnett & Co.), W. G. Dean (W. G. Dean & Son), John Holmes (New York Biscuit Co., New York), E. C. Rich (E. C. Rich Co.), Edward Elsworth (the Clover Mills), A. D. Rohrer (C. J. Van Houton & Zoon), N. R. Cottman (Alexander Eyquem), Robert M. Floyd (S. H. Street & Co.), Daniel Browne.

WOMAN'S SPHERE.

WHAT SPECIAL CULTURE BEST FITS WOMAN FOR LIFE'S DUTIES?

The meeting of "Sorosis," on December 7th, was a very interesting affair. Besides the regular members there were present many guests of note, including the wife of Max O'Rell, the wife of Bishop Simpson, the wife of Col. Roebling of Brooklyn Bridge fame, Mrs. Davis and Mrs Dickinson of the King's Daughters, Mrs. Scrimgeour, Mrs. Bailey of Orange, Miss Dennis, one of the World's Fair Commissioners; Mrs. Thomas of the Orange Woman's Club, Mrs. Cogswell, Mrs. McElroy, Mrs. Mary A. Kidder, and Constance Howard (Mrs. Stowe). When these guests had been duly presented and the preliminary entertainment of music and recitation had been duly applauded, the Chairman of the day, Mrs. Margaret T. Jardley, presented for the discussion in which Sorosis delights the very practical question: "What kind of education will best fit women for the duties of life?" Very briefly the Chairman pointed out and classified the duties of a woman's life as religious, personal and social, adding: "Our personal duty that we owe ourselves, that we may make the best of ourselves, is to be chaste, temperate, truthful, brave, and free in the condition God intends for men and women. Our social duty is simply the broadening out of our personal duty to our families, our neighbors, society, the State, and the country. Social duty is the fulfilling of the law, to do unto our neighbors what we would have our neighbors do unto us with love in our hearts." Jenny June presented the advantages of a literary education as a preparation for woman's duties, not as a professional means, by which to make a livelihood in writing or teaching, but for its discipline and development of all faculties; first, in the knowledge of the signification and value of words resulting in correctness in their own and their children's speech, accuracy of statement and distaste for exaggeration, which is first cousin to falsehood; second the cultivation of taste, which will not tolerate the false and worthless rubbish which passes current in paper covered novels, where paper men and women revel in fine millinery, and an utter disregard of language or logic. It commands rather the society and communion of the best writers as a stimulus to latent intellectual powers and heroic purposes and higher ideals. Women have special sympathy for this culture for culture's sake, and special use for it in the family and society. Men are of necessity given up to business and depend upon women to furnish the intellectual and spiritual side of life. Literary culture tends to foster a spirit of exclusiveness and carefulness in choosing associates. It removes from women the curse of poverty, which is ignorance, narrowness, prejudice, and endows us with the refinement and breadth and beauty of a better world, where the pin pricks of daily life cease to hurt us, and we have the great and noble for personal friends, who care nothing for the cost of our dwellings or whether we entertain handsomely or simply. Mrs. Jennie Lozier, the President of Sorosis, advocated the importance of medical or physiological study as a preparation for women's duties, because the peculiar duty of woman, one she cannot relegate to any one else, is the care of her children, and the indispensable preparation for this duty is health for herself, and health to transmit to her offspring, and such knowledge as shall enable her to retain it for both. Heredity, although a potent factor in the product of health, is not fatality. Its complement is environment. Health is not a positive quantity. It is, like beauty, a harmony. Symmetry is the law of its development, and education must be directed to the whole or we shall have monstrosities either intellectual or physical. You cannot play a harmony with one finger. The harmony which thrills from the harp of life seems to come from five strings—nutrition, respiration, activity, sustenation, and cerebration, and the essential woman's knowledge is that which governs the best development of these elements in her child. It is surely no insignificant sign of the times that sickness is no longer fashionable, and we do not now 'enjoy poor health.' In the smaller towns girls have fainting fits and matrons break down with nervous prostration. The city women are plump, rosy, and strong in comparison. It seems that the country women are killing themselves with strong tea and mental vacuity. The occupations and excitement of city life are tonic to our brains and nerves, but we must remember that every tonic has its corresponding depression and may be abused. Activity and rest should alternate in due proportion and mark the rhythmic harmony of health." Mrs. Terhune (Marion Harland) argued the domestic education as pre-eminent in importance to women, and that while the morals of the community and the integrity of the nation depend upon the manner in which the home is kept, a practical knowledge of what underlies home comfort is absolutely essential to a well-equipped woman. In the present condition of trained labor and the system of domestic service no American girl can afford to be ignorant of the humblest details of what is popularly known as housework, otherwise she is at the mercy of her servants. It may sound like bald realism to say that conjugal devotion depends largely upon how the family steak and potatoes are cooked and served. But when we consider the intimate relations of body and mind, the theometric influence of the digestive organs upon the spirits, the realism rises into the dignity of a moral axiom. Shall we not concede an honorable place to that training that instills punctuality, thrift, and helpfulness, that makes a girl robust in body and in mind, that fits her to fill with honor the place of housewife and home-maker, and to set upon her sons and daughters the imprint of a noble and beneficient personality? Mrs. Ella Dietz Clymer said that she would answer the question in a single sentence, for the kind of education that best fitted a woman for her duties was the education of the heart. Carlyle says a "loving heart is the greatest teacher," and a loving heart is in a woman's life the foundation stone upon which the superstructure should be built. Portia, inspired by her great love, went into the court and saved her husband when wisdom had failed to win his case. Choose your life work and let that educate you. In loving service our natures are trained, disciplined, and educated. Expansion of sympathy enlightens the mind, and the education of the heart is necessary to a woman in fulfilling her whole duty to God and to mankind. This simple little speech received more applause than did any that preceded it. Then Lady Somerset spoke in her rich, melodious English voice, and after thanking Sorosis very graciously for the pleasure and profit derived by the stranger guest at the meeting, Lady Somerset said: "The world is waking up to the great difference between woman's position now from the position she formerly held. No one would dare utter now in public the prayer of the old Scotch minister. 'We thank thee, Lord, that thou hast given us women to make us comfortable.' The old order changes, and woman's education embraces a wider outlook than ever before. In considering the question of woman's sphere and the kind of education which shall best prepare her for its duties we must look upon her as a life giver and a law giver, of which the first is paramount. Many of the ills flesh is heir to might be overcome and obliterated if this idea could be kept before women. The most sacred duties of life are presented to people when they are poorly prepared to find the solution of its problems. The mother's education is a sort of moral tobogganing. The children are sent out into world to land where they will. But we have passed beyond the old idea that ignorance is innocence and knowledge necessarily vice. It is the duty of every mother to gather her girls around her and tell them all they should know, all God meant for them. It is her duty to do this in fidelity to her husband and faithfulness to her children. And of woman as a law giver, not entirely in a political sense, for woman makes the laws, sets the tone, creates the morals of society, and any education that fits her for this is the best she can have. The moral tone of the world hangs upon the moral tone of its women. Politically English women seem to be in advance of American women. Pardon me if I err in my opinion. When all women realize their power they will not tolerate the evils of the present—will not allow the public work of the statesmen to give the lie to their private lives. They will demand that men shall be good and pure even as women are brave and true. Until women take an intelligent interest in politics the best men will stand aloof from political work. Let every mother influence her sons for the best and noblest, and through them she shall influence cities and countries. The least education is, indeed, the true education for women, for it is love that sends us out into this great weary world to try to make it better and brighter for our having been here." Mrs. Eva Douglas talked of education by travel, and concluded that if a woman was going to lecture she couldn't circle the globe too many times, and always with a camera strapped over her shoulder, as illustrated lectures were most popular. But if she was to mother a large family of children she would be better fitted for her duties if she didn't travel at all, for the fascination for journeying strengthened with every trip, and would disturb her tranquility and peace of mind. Mrs. Septima M. Collis read a long and humorous paper on the topic of social education, wherein was couched much sense in nonsense, and were told many truths under cover of keen sarcasm. The chief essentials of social success were beauty (of which its owner must feign

ignorance); cleverness and intellectual gifts (but the clever girl, if she would be popular, must seem always to be acquiring wisdom from every friend, never to be giving knowledge to a friend); and accomplishments which she was always to be generous in sharing with her acquaintances but never anxious to exhibit. Finally, the greatest of these three was the divine gift and grace of tact. "The woman who would shine in society must let society shine on her. She can give no light to it unless she absorbs its light. It is friction with the world which brightens the metal that is in her and keeps her young; absence or indifference dulls the appetite, rust surely follows, and she finds herself with the rest of the rubbish on the upper shelf, forgotten and unmourned. Nothing but physical infirmity serves as an excuse for a talented woman's withdrawal from the world of women Even bereavement has allotted to it by custom only its brief period of mourning."

ANIMALS' SPEECH.

SOME CONJECTURES ON THE MENTAL PROCESSES OF AMIMALS.

In our issue of July 30 (page 364 of the present volume), the readers of the AMERICAN ANALYST were informed of the experiments now in progress by Prof. F. L. Garner to detect in the utterances of monkeys an intelligible means of communication. An editorial writer in the New York *Times* of November 29 says on this subject: The orang outang of Lord Monboddo was introduced into scientific circles by Lamarck at the threshold of the century, and became much later a popular figure under Charles Darwin. It may be recalled how Thomas Love Peacock made him a "striking" character in fiction when he wrote "Melincourt" and described Sir Orang Haut-ton, the speechless, who obtained a baronetcy and a seat in Parliament, notwithstanding his inability to articulate. In the interim between Lamarck and Darwin, the writer of grotesque German tales, Hauff, followed Peacock with the same idea, but with a German, not an English, setting and satire. Both may have pondered the passage in "Origin and Progress of Language," which says: "In general, I believe it will be very difficult, or rather impossible, for a man who is accustomed to divide things according to specific marks, not individual differences, to draw the line between the orang outang and the dumb persons among us; they have, both, their organs of pronunciation, and both show signs of intelligence by their actions." It has taken about a century to place an idea which seemed so ridiculous that it was seized upon as stuff for satires well within the limits of attainment. The instruction of the deaf and dumb reaches a point when articulate sounds can be taught to those who cannot hear them, and the faintest changes in vocal expression can be stored up in an instrument and repeated by that instrument as slowly as wanted. At the same time it has become clear that animals can be perfected in other directions than those on which they have been improved hitherto. We breed horses for speed and color, dogs for speed, for specialties like pointing and retrieving, and for their color and temper, birds for their voices and looks, cattle for their milk-giving or other qualities. But so far we have not bred animals with an eye to general intelligence, having been stopped by ignorance of any fixed and intelligible method of communication with them, which might also be used between beast and beast for their further advance. Now, however, we have glimpses of a speech for animals. The chief difficulty, remarks Prof. E. P. Evans in the *Popular Scientific Monthly*, attending the investigation of mental processes in animals, is that they cannot express themselves in human language and explain to us their thoughts and feelings and the motives underlying their conduct. "We are thus liable to misinterpret their actions and deny them many endowments which they really possess, just as the first explorers of new countries fail to discover in savages ideas and conceptions which are afterward found to characterize them in a remarkable degree." It may be remarked that primitive peoples granted far more intelligence to beasts than we are disposed to do, and very commonly made them the incarnation of spirits. In the Middle Ages the classical story of Gellert emphasized the drawback under which the most intimate friend of men among four-footed beasts labors through lack of speech. Gellert was the faithful hound of a Welch Prince that killed a wolf in defense of the Prince's heir, and, supposed to have torn to pieces the child, was slain by the Prince because speech was lacking to inform his master where the babe lay safe. It is indeed hard to believe that the dog intrusted with articles to keep, like the mongrel in the grocer's cart, or accustomed to patrol the passes like the St. Bernard, or sent to the corner store for parcels and letters like a thousand dogs of different breeds, or trained to read blocks, walk on their hind legs, sit at table and use knife and fork—is not a rational being like a small child and cannot be developed by a course of training and careful breeding into an animal far superior to the best of the canine race to-day. At any rate, there is a liklihood amounting almost to certainty that we can discover methods of communication with animals that will greatly increase the pleasure and profit derived from them and save them from much suffering. Prof. Graham Bell even believes that dogs may be taught words, and while noting that Leibnitz had the same belief two centuries ago, Prof. Evans points out that a language will be to the dog of incalculable value as a means to enlarge the animal's sphere of thought. It is possible that a step in the right direction has been made in this country by Prof. Garner, who thinks that he has discovered that certain sounds uttered by monkeys are understood by them to mean certain definite things; or, at any rate, certain categories of ideas. His experiments have created much surprise and interest in Europe. According to recent reports, he proposes to visit Central Africa in order to study the sounds made by the great tailless apes, gorillas and chimpanzees, which are generally considered animals on as high a level as any in the world. By some they are placed on the same level with dogs, by others considerably above. Prof. Garner is certain that the uttering by him of a sound which, he was led to believe, suggests to monkeys the idea of peril, death or bodily harm, has been followed by signs of abject fear in a number of monkeys with which he has experimented. Very naturally there is room in such experiments for a wide margin of mistake. The monkeys may have been frightened by something in his attitude or tone. And it is certain that Prof. Garner's latest reports tend to widen the category of ideas to which the baleful word in monkey language may apply. Nevertheless, there is much to be learned from such experiments, though nothing be discovered that could properly be called a language, and though little more than cries such as we know most animals use reward the patient student for his labor. In the days of the cave-dwellers mankind did not feed and ride the horse, but simply slew and ate it. Since domestication the horse has had its innings by killing a goodly company of human beings every year. Yet, in truth, it is no malignity in the noble animal that causes the greater number of fatal accidents; it is the beast's lack of brains, for which men are partly to blame. They do not keep horses in such a way as to encourage what small brains they possess; and very commonly they do not know the horses they ride and drive. With the perfecting of animals for brains as well as brawn, the horse may be remembered. Perhaps the day may come when Yahoos and Houyhnhums will approach each other, and the centaur, that ancient forecast of an improvement on man, shall have a closer imitation than we find in the modern equestrian.

CHINESE WAX.

THE CURIOUS WAY IN WHICH IT IS COLLECTED.

"The most interesting article of all the many curious things which enter into the trade of China is 'insect wax,'" writes Minister Denby from Peking to the Department of State. "This product, sometimes known as 'white wax,' is obtained in western China, not far from the frontier of Thibet. It is gathered from a tree called by the natives the 'crackling flea tree,' from the popping of its branches when burned. The tree is an evergreen, and in the spring it bears clusters of white flowers, which are succeeded by fruit of a dark purple color. Botanists have classified it as *ligustrum lucidum*. Early in May numerous brown, pea-shaped scales appear on the bark of the bows and twigs. These, upon being opened, are found to contain a mass of small animals, resembling flour in appearance, whose movements are almost imperceptible. The animals are the larvæ of the white wax insect which owns the scientific name of *coccus pe-la*. People gather the scales and carry them to the Prefecture of Chia-ting, which is the centre of this industry. For the journey they are wrapped in packages containing about sixteen ounces each. The utmost care is taken to protect them from heat, in order that the larvæ may not develop prematurely. The city of Chia-ting stands in the midst of a plain which is an immense rice field. The plots of ground into which this vast field is divided for purposes of cultivation are edged with stumps from four to twelve feet in height, bearing numerous sprouts upon their gnarled heads. These stumps resemble at a distance pollard willows. The trees, however, are a species of ash, and are called by the Chinese 'white wax trees.' Beneath their branches the white wax scales are suspended in small packages wrapped in leaves, about twenty or thirty scales in each package. Holes are punched in the leavy wrappings, and the insect on emerging from the scales creep up the boughs to the leaves of the trees, among which they remain for two weeks. At the end of that time they crawl back to the twigs and branches, on which the females deposit their eggs and the males excrete the substance known as white wax. The first appearance of the wax on the under sides of the boughs and twigs resembles snow, and it gradually spreads over the whole of the branches to the depth of a quarter of an inch. At the expiration of 100 days from the placing of the insects on the trees the deposit is complete. The branches are then cut off. As much of the wax as possible is removed by hand, but to secure what remains the branches are afterwards boiled. This boiling destroys the eggs, thus making necessary the bringing of fresh scales the following year from another locality, as above described. A pound of scales, it is said, will produce four or five pounds of wax. The wax scraped off is put into boiling water, where it melts, and rising to the surface, is skimmed off and put into moulds. Here it solidifies and the work of manufacture is complete. The insects, which have sunk to the bottom of the pot, are pressed out, and, when the wax has all been extracted from them, are fed to the pigs. A ton of the wax is worth at Shanghay about $1,000. A tree from which the branches have been removed is not available again for productive purposes until the third year following. If the wax is left on the tree, the male insects buried under it undergo a metamorphosis, emerging with wings in the autumn and flying away. This white wax is a substance of great utility in China. It melts only at a very high temperature, 160 deg. Fahr., and is chiefly employed to cover candles made of animal and vegetable tallow, to prevent them from burning too rapidly. It is used in some localities as a sizing for paper and cotton goods, a glaze for silk, and a polish for furniture. Also it is utilized in southern China as a polish for stone ornaments. Immense quantities of it are shipped from the ports of the upper Yang-tse in junks. The intro-

duction of foreign kerosene, now so universally used in China, has had a discouraging influence on the production of 'insect wax.' Mineral oil in lamps affords a cheaper light than tallow candles. It is possible, however, that a use for the product may be found in other countries."

HUMAN EFFORT.

WHAT ENGROSSES THE MINDS OF THE ACTIVE HALF OF THE WORLD.

When it is pointed out that an alleged half of the world doesn't know how the other half lives, the speaker is apt to wear a wiseacre air characteristic of the thoughtful person. What is always meant by the remark is that the speaker himself professes not to know much of the daily life of the very poor or the socially predaceous. But there remains still a full half of the world of whose life it is safe to say that the supercilious fragment knows even less than it does of that of the very poor. This remaining half is so astonishing in its activity that a glance at it can scarcely fail to minister to the pleasure of our readers. Sweeping this active half of the world, then, with a glance, we perceive it engaged in figuring up the piston surface for a pumping engine and the diameter of an aqueduct pipe; tracking the bug to his lair and destroying his egg, exterminating mosquitoes and measuring earthquakes; making new probes to pull things out of folks' ears with; modeling creatures in clay and carving them in stone; designing World's Fair buildings for Chicago, and other buildings for Madison and uncounted other squares, and Cathedrals for New York; measuring the women's diaphragms to show why their noses are red. Disinfecting sewage and disengaging aluminum; intercepting the floating germ and setting him to slay the innocent rabbit; finding drugs whose tremendous potency mocks even the purple fluid in the apothecary's shop window; ridden by nightmares and fashioning women's garments after the vision; speeding house elevaters and testing timber trees; determining the course, S. E. and by S., half S., which Sirius was sailing nine years ago when the light we get to-day set out from him; trying new crosses of blood for race horses and fantail pigeons; painting impressionist pictures and composing music of the future and telegraphic cipher codes while mad-houses and suicides' graves multiply on every hand; applying liquid fuel and improving screw propulsion; identifying Sing-a-Song-of-Sixpence with the funeral chant over the body of Patroclus. Finding out how cold the moon is, why water feeds the flame of burning oil, and observing the effect of electric light on trees, keeping them awake; photographing a wink and tracing the history of rain gauges; devising apparatus to test the adulteration of wine, and adulterants to beat the apparatus; devising better material for underclothing, new models of yachts, binnacles and oil-serving swabs to still storm waves and improve methods of brewing beer; devising dynamite guns, mill worker's homes, and glue that doesn't unstick; determining the apex of the sun's way near Lyra and not Hercules; trisecting an angle and recording the chemical life history of Jerusalem artichokes. Sounding the sea, hatching fish and finding out what kills the oysters; making butter out of petroleum and honey out of shingles, with by-products which smell like a cow's breath and blow up with forty thousand horse-power; identifying the rheumatism microbe and subcutaneously injecting heart juice for heart failure; poisoning marine worms, propelling bicycles by electricity and making submarine torpedoes out of paper; making folks wash themselves; proving by mathematic demonstration that the vortex atom is the one thing in the universe that really does exist, when along comes Edison, saying the atom knows good and evil, just like folks. Raising ghosts and ghostesses, inventing chess problems for gain, and getting real money for treatises on grammar, on the immortality of the soul, on the moral purpose of Shakespeare's plays and of Walt Whitman's style, and diagnoses of Byron's club foot and Richard III.'s abnormal spine. These are some few and very few, of the ways by which that stirring half of the world, which is neither very poor nor thoughtful, actually lives. Is it to be doubted that the fragment which titters to confess it does't know how the poor half does live, commonly knows even less about how this ingenious half is living and what it is living for?—*N. Y. Sun.*

EVOLUTION OF FLOWERS.

HOW FLORAL FERTILIZATION IS EFFECTED BY INSECTS.

At a recent meeting of the Pharmaceutical Society Prof. J. B. Green read a paper on the above subject, of which we append the following abstract: "The flower has a special importance to us in studying the life history of the plant. It is the indication of its endeavor to discharge the second of the duties of the organism, the preservation of the species, or the propagation of the race. It consists of parts whose meaning is only evident when regarded from this point of view. On a stalk there are superposed successive whorls of modified leaves, known as sepals and petals, and within this two other whorls the stamens and pistil. Of these the stamens develop, in their club-shaped heads or anthers, a number of grains of various forms, known as pollen, which give rise to what is the male element in reproduction. The pistil, or collection of carpels, develops the ovules, in which we have the female cell ultimately produced. The problem of reproduction involves the transference of pollen from stamen to carpel in an organism which itself is passive and motionless. The pollen must reach a particular portion of the carpel known as the stigma, which is usually its uppermost part, and here the changes leading to fertilization are initiated. It has been found by Darwin and others, in long continued experiments, that the best offspring is produced when pollen from one flower is applied to the stigma of another flower, either on the same plant or on another plant of the same species. This cross-fertilization, as it is called, has given rise to curious and interesting mechanisms to secure it. The original flower was probably one of a very humble type, such a one, indeed, as we now find on our forest trees. It had no particular color, and was not conspicuous among the foliage. It produced large quantities of pollen, and was often provided only with stamens or with pistil. It was fertilized by natural agencies, of which the wind was the most usual. From such a type the various highly colored, scented, and curiously shaped flowers we now know have been developed. In the order of such development the aid of the insect world has been prominent. To effect the change from wind fertilization to insect fertilization is the initial difficulty; that once effected, various modifications would soon ensue, and those that were advantageous to the plant would be preserved by natural selection. Now, insects are largely feeders on pollen, and it is easy to see how the vast amount of pollen produced by such a flower would attract an insect to visit it. The successive visits of the insect to various flowers would result in the deposition of pollen from one on the stigmas of the others, so that the first insect fertilized or entomophilous flower would arise. It would be in character such as would be due to the influence of quite a short-tipped insect with a feebly developed sense of color. We find instances of these still existing, quite simple in structure, wide open, regular in shape, and offering only pollen to the insect, and either white or yellow in color. But many flowers offer another attraction than pollen, in the shape of honey. It is not uncommon to find honey secreted by other parts of the plant than the flower. If we suppose that this secretion of honey at some time came to be poured out on the flower, such a flower would have an increased attraction for an insect—and this property, possibly arising accidentally at first, would be perpetuated, and so the nectary come to be a regular part of the flower. A further development would follow in the shape of various mechanisms for the shelter of the honey from rain, and so lead to its being hidden in tubes or spurs, and accessible only to particular insects. The development, so briefly sketched out, has not proceeded along one line. Many visitors have been attracted by flowers, and each has led to particular modifications. I shall to-night consider only two of these—the fly and the bee. The fly is an insect of a low order of intelligence, shy and lazy. It is attracted both by pollen and by honey, and the structure of its mouth enables it to eat both of these. Its peculiar characteristics have led to the development of flowers, which secure it in a kind of prison, and retain it for a few days, ultimately releasing it. Such are the flowers of aristolochia and arum In both these the fly enters by pushing past a fringe of hairs which are set at an angle inclined forward. The insect is by these prevented from going out. The stigmas of the flowers are ready to receive pollen on its entrance, and if it has emerged from another flower it is dusted with pollen, which, as it crawls over the stigmas, it leaves behind it. After a day or two the stigmas in the prison fade, and the anthers ripen and discharge their pollen, with which the visitor becomes coated. At this time the hairs wither and the fly is enabled to escape, and to visit other flowers, where the same programme is repeated. The low intelligence of the fly is taken advantage of by the so-called grass of Parnassus. In this a number of shining knobs are developed in a part of the flower near the stamens, and from a distance these look as if coated with honey, and the fly, deceived thereby, visits flower after flower and effects fertilization. A higher type of flower visited by flies is seen in Veronica, where honey is hidden in a small tube in the centre of the flower. To reach it the fly is obliged to hold on by the stamens, and in so doing it dusts its body with pollen, which, on a visit to another flower, is deposited in the stigma, this being so placed as to touch the insect before the stamens do. The conspicuousness, however, which first attracted the fly also attracted other insects, whose visits did not always lead to the desired end. Even highly organized flowers still suffer from this disadvantage. The flowers of the columbine, oxlip and bean are still visited by short-tongued bees, which cannot reach their honey in the legitimate fashion. These bite holes in the petals and steal it without benefiting the flower. We have to look to this fact for the explanation of arrangements to protect the flower from these depredators. We have these, seen best in the so-called bee-flowers. Bees as a class of insects are characterized by more intelligence and greater industry than flies; they have a higher color-sense and a more complex mouth. With these endowments we correlate the fact that, unlike flies, they store up food for their young. Some of the more interesting types of bee-flower are seen in the leguminosæ, where elaborate mechanisms lead to the dusting of the visitor with pollen on the part of his body to which the stigma of the next flower must be applied. In lotus the pollen is forced out of the flower by a sort of piston, made of the dilated ends of some of the stamens. This is made to work by the weight of the bee when it alights upon the flower. In the broom the same effect is secured by a sort of explosion, which takes place when the bee commences its search for the honey of the flower. In the violet a curious cup-like hinged projection has been developed, which opens as the tongue of the bee, coated with foreign pollen, passes down the tube of the flower, but closes and covers up the stigma, when it is withdrawn carrying pollen from the flower's own stamens. In the barberry and in the corn-flower the stamens have become endowed with a peculiar irritability, which subserves the same purpose of dusting the visitor with pollen. In salvia, the sage, a curious modification of part of the stamen into a lever leads to the pollen falling on the

back of the bee, where the stigma of the next flower visited finds it. The various forms of orchids introduce us to still more elaborate mechanism, rendering fertilization without insect aid impossible. The development of color in flowers, and the explanation of the various markings on the petals, must be studied also in connection with insect life. Probably white and yellow flowers were the earliest, the first distinction being drawn thereby between flower and foliage. These were visited, probably, by lowly forms of insects, as they are to-day. When honey began to be secreted and hidden more distinctiveness was needed, and the insects with a high color-sense became the agents of further modification. The markings on the petals, usually straight lines or rows of dots, pointed the insect to the part where the treasure lay. So the development of blues and reds accompanied the evolution of the elaborate mechanisms already described. Of lowly forms, with easily accessible honey, Muller has shown 60 per cent. are visited by flies, as against 3 per cent. by bees—while of reds and blues it can be noted that the reverse obtains. Flies visit yellow or white flowers more than twice as frequently as red or blue ones."

RIGHT AND LEFT HANDED.

SOME CONJECTURES AS TO THE CAUSE OF THE HABIT.

Man is not only a biped without feathers, according to the definition of Plato, but is also the being which possesses the best organized, the most supple, the most adroit hand; and it is almost impossible to give an adequate idea of the exact part which this hand has played in the history of civilization. While, however, the hand is an admirably supple and varied tool, we know that of the two copies of that tool which every human being possesses, the one has a notable advantage over the other. Why? This question has been often put. The discussion about it is still going on and will doubtless last for a long time to come. What cause favors the right hand, and what determines occasionally the preponderance of the left hand? With the discussion of these questions Sir Daniel Wilson, President of the University of Toronto, has filled a volume of more than two hundred pages. To establishing the fact of the immense preponderance of right-handedness now and in past times, he seems to us to have given more space than is necessary. According to the anatomist, Hyrtl, of Vienna, the proportion of left-handed people among the civilized races of Europe is two in a hundred. Sir Daniel, who is left-handed himself, regards his left-handedness as congenital; but while some have from birth a marked inclination to use one hand, others have an equally marked inclination to use the other; among the majority, however, there is no very marked inclination either way, and their right-handedness is the result of education. Incessantly parents direct their children to use the right hand rather than the left. As soon as the child begins to use his hands to gratify his wants, he is taught to take his spoon in his right hand. Besides the structure of very many articles makes the use of the left hand awkward. Later on, children are taught to write with the right hand, which receives a special education by the occurrences of each day. Sir Daniel Wilson himself, he tells us, has learned to write with the right hand, without finding any particular difficulty therein. He uses the left hand, however, to write on a slate, or when he uses chalk, or his penknife, and his brush. He holds his spoon and his table-knife in his right hand; but when he is tired or has a bit of meat hard to cut, he instinctively takes the knife in his left hand. If he desires to use more than common force—as to drive a nail or give a blow with the fist—or if he is doing something which requires extraordinary delicacy, he makes use of the left hand. Among famous left-handed people some deserve special mention, as, for instance, Leonardo da Vinci and Holbein, who have demonstrated by their masterpieces, that the left hand is naturally in no wise inferior to the right. Let us admit with Sir Daniel Wilson that, outside of the majority with whom right-handedness is a matter of education, there is a minority with whom right-handedness and left-handedness is the result of a very strong and persistent natural tendency. What is the cause of this one-sided tendency; why does it vary, and why is it not found in every human being? In the answers to these questions theories abound. Sir Charles Bell attributes right-handedness to the greater force of the right side of the body. Is this force, however, a cause or a result? Does the right hand predominate because it is more used, or is it more used because it is naturally predominant? Others say that man is right-handed when his viscera occupy the normal position, and that he is left-handed when there is a transposition of the viscera, because the transposition favors the circulation of the left side. To this theory there is but one objection, which is that the theory is not justified by the facts. Mr. A Buchanan, Professor of Physiology at Glasgow, in 1862, proposed a theory of the predominance of the whole right side and not of the hand alone. According to him, right-handedness is not congenital, but acquired by reason of the greater force of the right side, the force being due to greater weight of the intestines on the right side of the body, the centre of gravity of the human organism being nearly above the right foot. His argument is not very clear and, therefore, but moderately persuasive. The anatomist, Hyrtl, of Vienna, has proposed still another theory, which attributes right or left-handedness to the disposition of the great arteries which spring from the aorta. There remains the theory of Gratiolet, who a long time ago, found an explanation of left-handedness and right-handedness, not in the hand or the arm, or the structure of the body, but in the general centre of the activity which belongs to nervous elements and tissues, in the brain. This French *savant* explains right-handedness by the anatomical and physiological preponderance of the left brain, which, according to him, is developed more quickly and more completely than the right hemisphere, doubtless by reason of its better sanguinary irrigation. The fact of the superior weight of the left brain is incontestable, although Wagner and Thurman deny its habitual preponderance. On the other hand, the left side of the body is the weakest and most subject to disease. It is known that the function of language belongs more particularly to the left brain, and it would be not at all surprising if the right side of the body, in its relations to the left brain, owes its superiority to the greater powers of the left half of the brain. This theory of Gratiolet has so strongly impressed Sir Daniel Wilson that he has requested that his brain be examined, when he has finished his career. He is convinced that it will be found that his right brain is superior in weight to, and different in structure from, his left brain, as was shown to be the case with an inveterate left-handed man who died in 1887, and whose autopsy was made with special care in order to ascertain its bearing on the question here under discussion. It will be seen that the reason for right-handedness and left-handedness is not yet completely discovered. In our opinion, however, that truth will be found at the end of the road opened by Gratiolet. Many problems much more difficult in appearance than the one here discussed have been solved, and it would seem that with the resources offered by the hospitals the documents necessary for its solution can be collected.—*Revue Scientifique.*

ELECTRICAL ADULTERATION.—Her Kochler, of Berlin, recently made a statement before the Bavarian Society of Applied Chemistry, that during a visit to the Strasburg Exhibition his attention had been attracted to the remarkably beautiful green color of some preserved beans. Inquiry as to how this was accomplished elicited only the information that it was a trade secret. He subsequently learned, however, that during the boiling of the vegetables in question in a copper vessel an electric current was passed through the whole, the vessel itself acting as an anode, and that in this way large quantities of copper was carried into solution to which the fine color was due. —*Electricity.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEATS.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, duck, geese, turkeys, grouse, capons, hare, partridge, pheasants, rabbits, pea-fowls, guinea-fowl, snipe, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

PRACTICAL RECIPES.

BEEFSTEAK PIE.—Take a deep baking-dish, butter it, and line it with thin pie paste. Cut the bone out of a beefsteak, remove all fat and gristle, and cut the meat into pieces the size of your palm; beat each piece with a rolling-pin. Slice some white potatoes, put a layer of meat in the dish, then seasonings of salt, pepper, nutmeg, allspice, a little catsup and onion; put in a layer of potatoes, and over them some bits of butter; add another layer of meat, and then one of potatoes; pour in a little water. Cover with a crust and bake for an hour.

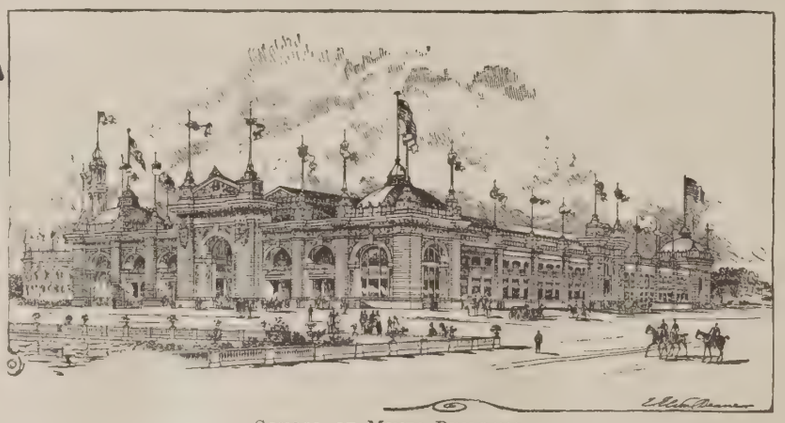
PICKLED TONGUE.—Rub a beef's tongue with a pound of fine salt, one ounce of saltpetre, and one half pound coarse salt; rub it well, and turn it in the pickle every day for two weeks. This pickle will do for several tongues by adding more fine salt.

VEAL PATE.—Chop three pounds veal cutlet very fine with a slice of salt pork, two eggs, broken in after the meat is chopped, six soda crackers rolled fine, a lump of butter the size of an egg, a teaspoonful of salt, cayenne and sweet herbs to taste. Mix the whole thoroughly, make up like a loaf of bread, and smooth the top over with melted butter, and bake thoroughly in a moderate oven. Let it get cold before cutting, then slice thin and serve.

ONION CUSTARD.—Peel and slice ten or twelve white onions, and fry them for a moment, until tender, in fresh butter, draining them well as you take them up; mince them as fine as possible; beat four eggs until very thick and light, and stir them gradually into one pint of milk in turn with the onions; season the whole with grated nutmeg, pepper and salt, and stir it hard; then pour it into a deep dish, and bake for about fifteen minutes. Serve as a side dish to be eaten with poultry.

RAISIN BREAD.—Two pounds flour, one pint sugar, one pint raisins, half pound of butter, five eggs, one cup yeast, one cup milk, one nutmeg, salt. Mix part of the flour, milk and yeast at night to rise, and work in the other materials in the morning.

BREAD DOUGH MUFFINS.—Take about as much dough, after it is ready to bake, as will make a small loaf, and mix with it enough milk to make a batter; let it stand for an hour, then bake in muffin rings.



PRESERVED LEMON PEEL.—Let some fresh lemon peels soak in cold water until the white pulp can be scraped off, then boil them until soft, and preserve them in half their weight in sugar; use as a substitute for citron.

THE COLUMBIAN EXPOSITION.

FACTS OF GENERAL INTEREST.

Von Houten & Zoon, the manufacturers of cocoa at Weesp, Holland, have set apart $100,000 with which to make a splendid exhibit at the Exposition in Chicago in 1893. They intend to erect a large building in the style of old Holland architecture of the fifteenth century, and to put in it, besides an exhibit in their own line of business, paintings, views, bric-a-brac, etc., illustrative of the Netherlands and the life and characteristics of the Dutch people. They will have there a "cocoa school," where Dutch maidens, clad in picturesque attire, will make delicate cocoa beverages according to the most approved methods, and will serve it to visitors.

Dr. Edward Bedloe, United States Consul at Amoy, China, who has been an active promoter of the interests of the World's Fair, writes to Chief Handy that, in all English-speaking circles in China, there is a great and growing interest in the Chicago Exposition. In addition to other work he has secured promises from eight friends to send on their private collections of curios and bric-a-brac in 1893, and hopes to obtain most interesting collections from Amoy and from Formosa.

SCHOOL OF MINES BUILDING.

Prof. Ward, the well-known mineralogist and scientist of Rochester, N. Y., called upon Director-General Davis a few days ago and offered to send his entire collection of geological specimens to the Exposition. His collection represents the expenditure of a great deal of money and the work of years, and is one of the most complete in this country. At the Centennial Prof. Ward was allotted space 120 x 130 feet. If he can secure it he will fill considerably more space at the Exposition of 1893.

Colombia will celebrate the anniversary of its independence, July 20, by opening an exposition on that date in 1892. The exposition will continue until the end of October, and will embrace an extensive showing of the resources and products of the country, and also a historical, archæological, and ethnological exhibit. At the close of the exposition the whole collection, or the best part of it at least, will be sent to the World's Fair at Chicago as a part of the exhibit from the Republic of Colombia.

The World's Fair Committee of the American Jersey Cattle Club has addressed a circular letter to every breeder of Jersey cattle in America, for the purpose of enlisting his aid in securing for the Jersey breed a creditable representation in the live stock department of the Exposition, and in the dairy tests which are to be made. This committee is composed of J. J. Richardson of Iowa, W. J. Webster of Tennessee, John Boyd of Illinois, and F. E. Shaw and P. J. Cogswell of New York, all of whom are well known cattle breeders. In their circular letter they say that it has been decided to show at the Fair a herd of fifty Jersey cows in milk, and that the association will bear all expense of transporting, caring for, and feeding them. The breeders are asked to furnish one or more of their finest cows to this herd. The letter gives also the terms of the proposed milk and butter tests. The prospects are most encouraging that all of the chief breeders of dairy cattle will be represented by herds of fifty exceptionally fine animals, and that the tests will be so successfully conducted that the results will be quoted as standard authority for years to come on the question of the relative merits of the respective breeds.

The monster Manufactures and Liberal Arts Building requires more than two hundred car loads of lumber, or 3,000,000 feet, for its flooring alone, and five car loads of nails to fasten it down. Three electric saws are kept running night and day sawing and sizing the flooring. Twenty buildings of the size of the Auditorium, or 1,000 houses 25 by 50, could stand on this mammoth floor.

Medusaline, a new composition designed as a substitute for brick and building stone, has been adopted for the sidewalks and driveways in the Exposition grounds. The Committee on Grounds and Buildings granted the contract to the Medusaline Manufacturing Company of Chicago for the construction of 450,000 square feet of such sidewalks and driveways. The price is 6½ cents per square foot. The concrete composition to be used by the contractors is said to be as hard as perfect stone, and it is now thought probable that it will be used instead of staff for the exterior ornamentation of the Fine Arts Palace, and several other buildings.

Wyoming's building at the Fair will be of the French cheateau style of architecture, 50 by 70 feet, two stories high, and will cost about $20,000.

The Chicago Furniture Manufacturers' Association, which has a membershtp of 210, and an aggregate capital of $26,000,000, proposes to make a united exhibit of mammoth proportion in the furniture and upholstery line.

Rev. Dr. S. J. McPherson, of Chicago, at the instance of a number of associates prominent in religious circles, will correspond with individuals and societies in the various denominations with a view of having a conference of delegates from all parts of the country to arrange for a religious exhibit at the World's Fair.

Some rare old curios in the way of saddles and ancient harness will probably be seen at the World's Fair. The National Association of Saddlers has decided to raise $35,000 for an exhibit of their trade at the Fair. This will be expended, largely for ancient saddlery and harness which will be procured through special collectors.

Aquatic fowls of all climes will probably swim about in the lagoons of Jackson Park during the period of the Fair. Landscape Architects F. L. Olmstead & Co. recommended the purchase of a great variety of water fowls. The list includes widgeons, sea gulls, swans, brown pelicans, storks, sand-hill cranes, American wild geese, blue geese, toulouses, flamingoes, snow egetes, and scarlet ibes. The purchase of at least ten of each species of the birds as enumerated was recommended.

The great dome of the Administration building, which will be the most conspicuous architectural feature of the Exposition, and the four smaller domes, will be covered with aluminum bronze, a newly discovered amalgam, which is said to glisten brighter than gold. The contract for gilding the domes has been let for $54,000.

Ceylon has sent, through, Sir Henry Wood, a request for space upon which to build a tea house.

Pueblo, Col., is raising money with which to equip and send to Chicago a "cowboy band."

The jewelers of Hanau, the great jewelry center of Germany, have decided to make a united exhibit at the Fair. Members of the Association have received great encouragement from the imperial government.

Nearly $700,000 of insurance has already been placed on the Exposition buildings in process of erection. The insurance will be constantly increased as the structures grow.

Director-General Davis has made a report to the Committee on Awards in which he says that 142 juries, embracing 659 jurors or judges will be necessary at the Exposition. He believes that appointment on these Juries of Award will be considered a high honor and that a better class of jurors will be secured if no salary is offered. He recommends, however, the payment of six dollars a day to each juror in lieu of expenses. He thinks a prize of $500 should be offered for the best design for a medal, two prizes of $250 for the next best two designs; and like prizes in case of designs for diplomas. The government is expected to appropriate about $500,000 for carrying out the awarding of the medals and diplomas. It is hoped, too, that the medals will be struck in the Government building at the Exposition, and the diplomas will be prepared in the Bureau of Engraving and Printing at Washington.

The Illinois State Board of Charities will make an exhibit in the Illinois building.

The Consul-General of Japan at New York, Mr. Takahira, writes to Chief Skiff of the Mines department that the mining and metallurgical exhibit from that country in copper, gold, silver and lead will be something exceptionally large; also in porcelains, potteries, clays and bronzes.

COLD WINTER SIGNS.

A PREDICTION THAT MAY OR MAY NOT PREDICT.

"This is going to be a very hard winter," said an old resident of Allentown, Pa., "and I'll tell you why I say so. In the first place look at the hornets' nests. You will find them high up this Fall. That's a sure sign of a hard winter. If it is going to be a mild winter you will find them near the ground. Two years ago and three years ago the winters were mild and the hornets' nests were low down. Then take the angle worms for another sign. Dig in the ground now and you will find them crawling two feet or more below the surface. They know what kind of weather is coming and they go down to avoid the frost. Two years ago I found them not three inches under the surface and they stayed there all the winter. Fuzz on hogs is another sure sign of a severe winter. Butcher a hog now and you will find a thick fuzz at the roots of the bristles. The fuzz wouldn't be there if the next winter wasn't going to be a tough one. Two or three years ago this fall there wasn't any fuzz at all on hogs, and you know how open the winters were. I predicted a hard winter in 1855 from these signs, and my neigbors ridiculed me, or tried to, but we got in just as I said. I had so much faith in the signs that I got a lot of boys to trap all the quail for me that they could. I wintered over two hundred quail, and in the Spring of 1856 there wasn't a live quail in the Lackawanna Valley except the ones I had. I turned them all loose at various points, and in the Fall we had some good shooting, which we wouldn't have had if I hadn't paid attention to the signs."

THE TIME AT NIGHT.

HOW TO ESTABLISH IT BY THE STARS.

Most people in a clear day can, without a watch or other timepiece, form a closely approximate idea of the time of day by the position of the sun, but few, perhaps, have guessed at any similar method of computing the time during the night without any other means than the "starry skies." Notwithstanding, a fairly reliable time indicator can be found in the northern skies on every cloudless night. As is generally known, the group of fixed stars called the "Dipper" makes an apparent revolution toward the North star in every twenty-four hours, with the two stars forming the outer elevation of the bowl of the dipper pointing nearly directly to the polar star continuously. If the position of the "pointers" is taken at any given hour say six o'clock in the evening in winter time and as soon as it is dark in the summer, the hour can thereafter be pretty accurately measured by the eye during the night. Frequent observations of positions will have to be made at the given hour, as, owing to the constant changing of the earth's position in space, the position of the "pointers" in relation to our point of observation, and the star also change. Observations taken during the year and impressed on the mind will make a very good time indicator of that part of celestial space.

BUSINESS NOTES.

FLAT STEEL WIRE.

The production of the flat steel wire that furnishes the power of self-acting shade rollers is a very important manufacture, requiring technical skill of a high order in the various departments that the rod has to pass through, from its rough rolled state to the large coils of flat, highly tempered steel ready for the spring winding machines. The large rods are first subject to an intense heat in the muffler; thence to the acid baths, coating trough, and water treatment, after which to the highly heated bakers. This treatment prepares the rod for the powerful drawing flames, where the size is gradually reduced by being drawn through dies. When the diameter is small enough the wire is passed through rolling machines to flatten, then to the tempering department where the finishing occurs. A high grade of steel is the first necessity, and if it receives the best treatment, then a spring can be formed from the product that will be satisfactory. Mr. Stewart Hartshorn was the first to use steel wire in shade rollers. He at first, as his father did before him, used brass wire. The unsatisfactory nature of brass springs prompted him to make long and persistent endeavors to get wire drawers to produce correctly tempered steel wire in large coils from which springs could be wound. At last fair success was met with and the use of brass was discontinued. Many improvements have been made since the first steel spring was used in shade rollers. With the wish to still further improve, Mr. Stewart Hartshorn has lately built in East Newark, adjoining his Eastern shade roller factory, the most complete wire plant, with the latest machinery, most of which is of novel and original construction, to produce the best steel wire possible for his shade rollers. It is an interesting sight to see the new powerful Corliss engine driving the heavy machinery, to note the various manipulations through which the wire passes, and then when we are informed that every pound of the product goes into the Hartshorn shade rollers, we are impressed somewhat with the extent of the trade on this article.

CLEANSING VARNISH.—White spots on varnished furniture will disappear if you will hold a hot plate from the stove over them; or rub them with essence of peppermint or spirits of camphor.

SNOWED UNDER.—"Did you run for office the other day?" asked Spriggins of a defeated candidate. "No," said the candidate, sadly, "I walked. The other fellow ran."—*Somerville Journal.*

ARTIFICIAL SILK.—A German chemist has succeeded in producing artificial silk, which has all the qualities of the natural article except strength, wherein it is deficient, being only two-thirds as strong.

VALUABLE SECRET.—An important discovery, by means of which ordinary soft steel can be readily used for all kinds of tools, has been made by a man in Pennsylvania. The process is still a secret.

INK FOR GLASS.—A solution called diamond ink has been invented which enables one to write upon glass. It is necessary to allow it to remain upon the glass about fifteen minutes before wiping off.

DOMESTIC PHENOMENON.—"Robert, dear, how do you suppose those dozens and dozens of empty bottles ever got into the cellar?" "Why, I don't know, my dear. I never bought an empty bottle in my life."—*Brooklyn Life.*

WHY, INDEED!—"Have you got any stale buns?" asked Johnny Fizzletop, sticking his head into a pastrycook's shop. "Yes I have five or six dozen left." "Serves you right! Why didn't you sell 'em while they were fresh."

PENS AND SURGERY.—Vaccinating with steel pens is recommended by a French physician. The pens are cheap enough to allow of a fresh one being used for each operation, and thereby all danger of infection from the lancet is avoided.

LAND-POOR.—In Virginia there are 15,000,000 acres of arable land lying untilled. The greater part of it is the property of large holders, who get no income from it and who do not possess the capital needed for its cultivation. The State authorities have come to their aid and are striving to attract immigrants, who will take it up and put it to service.

NEW PEN WIPER.—The rapid oxidation of steel pens by the inks at present in use has set some German to experimenting, and he has found that if a pen, immediately after use, be stuck into a raw Irish potato it will last a far longer time than it does ordinarily, even with the best of care. The juice of the potato is alkaline, and thus neutralizes the action of the ink acids.

USEFUL PLASTER.—A plaster composed of one part of carbonate of lead in two parts of olive oil is considered in Holland to be an efficacious remedy for sprained joints. Dr. Duhamel has been trying the effect in Paris on a number of cases, most of which were sprains of the ankle, and it is said that patients were made to walk as soon as the plaster and retaining dressings had been applied.

PLASTIC SLATE.—A correspondent, writing to *Stone*, says: "It has been quite recently demonstrated that slate, ground up and bolted, can be made into a plastic mass, can be made involving great pressure, and the product then subjected to great heat, charged into an enduring and solid stone. The paste can be formed into anything that can be formed into moulds or by the hands, and everything that is now made from the actual stone can be formed in this way.

SOAPSTONE.—Soapstone, or Steatite, can be made into anything. Very beautiful stoves are made of it, and stationary washtubs and sinks are important products. Not an ounce need be wasted, for the dust is used to adulterate rubber goods, giving so called gum rubbers their dull finish, and in paper, too, it is used to give weight, while all waste can be ground up into a flour which can be made into a fireproof paint for the interior of mills or the roofs of buildings.

PENCIL PROTECTOR.—A new discovery has been made by railroad clerks in Pittsburg regarding the saving of lead pencils. The new idea to preserve a soft pencil is to take a gross of the useful article and place them in a jar of linseed oil. Allow them to remain in soak until the oil thoroughly permeates every particle of the wood and lead. This has the effect of softening the mineral, at the same time making it tough and durable. It has been found very useful and saving, an ordinary pencil being used twice as long under the new treatment.

TRADE-MARKS.—According to the decision of the Supreme Court of Pennsylvania, in the case of Hoyt et al. *vs.* Hoyt et al., the size, shape or mode of construction of a box, barrel, bottle or package into which goods may be put is not a trade-mark, and if a manufacturer has a right to use a certain label he may use it on any kind of bottle that is not patented, and he will not be restrained from combining his own label with a particular shape or style of bottle for the mere reason that the latter had been previously adopted by some other producer of similar goods.

A STEAMBOAT LOCOMOTIVE.—A steamer which can be propelled on land by means of its own engine has just been constructed at the Ljunggren Engineering Works, Kristiansstad, in Sweden. It is intended for the traffic on two lakes close to Boras, which are separated by a strip of land. Rails have been laid between the two lakes. The steamer, which has been christened very appropriately "Svanen," the "Swan," can run itself across from one lake to the other. At a trial trip at the works the vessel fulfilled the tests very well. The engine is ten-horse power, and the "Svanen" can accommodate sixty passengers.

LAKE LEVELS.—The following figures show the mean level of the surfaces of the great lakes above mean tide at New York and their maximum depths, respectively: Lake Ontario 246.61 feet, 738 feet deep; Lake Erie 572.86 feet and 210 feet deep; Lake Michigan 581.28 feet, 870 feet deep; Lake Huron 581.28 feet, 750 feet deep; Lake Superior 601.78 feet, 1,008 feet deep. The deepest water runs very fairly in mid-lake throughout the chain. The areas of water surface in square miles, according to Crossman's delineation, is as follows: Lake Superior 31,200, Lake Huron 23,800, Lake Michigan 22,450, Lake Erie 9,960, Lake Ontario 7,240, or a total area of 94 650 square miles.

CALIFORNIA TIN.—Deposits of tin. very promising in value. have been found on the eastern slope of Laguna Mountain, near San Diego, Cal.

EFFECTIVE CEMENT.—A most excellent cement for fastening leather, paper or wood to metal can be made by adding a teaspoonful of glycerine to a gill of glue.

HEROIC TREATMENT.—Bordier proposes to inject negro blood into the veins of unacclimated white persons who contemplate a visit to the yellow fever zone.

FURNITURE POLISH.—Furniture polish may be made by taking one and a half ounces each of alcohol and butter of antimony, one-half ounce of muriatic acid, eight ounces linseed oil, one-half pint of vinegar; mix cold. This will be found good.—*The Old Homestead*

NON-CONDUCTORS.—Among non-conductors, when used alone for steam-pipe and boiler coverings, may be classed wood strips, hair, wool, hair felt, wool felt, cork, infusorial earth, mineral wool, rock wool, pumic stone, sawdust, charcoal, paper pulp, plaster-of-Paris, ashes, and air spaces.—*Grimshaw's Hints.*

OIL AS FUEL.—The boilers that supply the steam for the big pumping engines at Brilliant, Pa., near Pittsburg, are now wholly heated by oil fuel. Experiments have been made with oil in combination with coal, wood and natural gas, but it has been found that the oil alone makes the greatest heat.—*The Safety Valve.*

LOST POWER.—The power absorbed by the reciprocating parts of an engine during each stroke is equal to their weight lifted as many feet high as would be necessary in order to produce their velocity by falling. This can be calculated by the rules relating to the velocity of falling bodies.—*The Weekly Stationary Engineer.*

MINUTE GIANTS.—An ant, three-eighhts of an inch long, carrying a burden of one-sixth of a grain, moves at the rate of one mile in eleven hours. This weight—a small one compared with what they sometimes carry—is eighteen times their own. In carrying this weight they compare with a man five and a-half feet high, weighing 140 pounds, carrying a ton and a-half of lead from St. Louis to Jefferson City and back again in twenty-two and a-half hours.

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy:

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

WHITE CEMENT.—White cement of the same character as Portland cement is made by grinding together three parts of chalk and one of kaolin, burning at a red heat and grinding again. The cement made by this process hitherto has shown a tensile strength only about one-half as great as that of good Portland cement, but it has the hydraulic quality and other characteristics of Portland cement, and it is to be hoped that the manufacture may be so improved as to increase the tensile strength to the point required for making artificial stone. If a white cement can be found for a matrix it will be easy to obtain aggregates of light color by utilizing white sand, marble dust, white talc, and so on, suitable for making a concrete which could be used in place of marble.

WHERE IS YOUR MOUTH?—It has been discovered that the human mouth is slowly but surely and steadily moving towards the left of the face, which will in time bring it somewhere in the neighborhood of the left ear. All the five great races of man have an uncontrollable tendency to eat only with the teeth which grow from the left jaws. This wears out the left teeth more rapidly than those on the right side of the mouth, and this in turn gives the upper and lower jaws an inclination towards the left. It is the expressed opinion of many scientists who are foremost in the world's roll of professional honor that in the course of time the mouth, from causes above mentioned, will have completely changed its position, and that it will then be situated rather nearer the left ear than the nose!—*St. Louis Republic.*

METROPOLITAN TIME.—Any observant man accustomed to the ways of this town need never depend on sun dials, clocks, or watches to guess the time of day. Dozens of restaurants and club dining rooms give him a close clue to the hours between 7 and 10 o'clock; the same is true of the noon hour, while the movements of shoppers and the varying character of those traveling on the elevated railroads are a sure indication as to other hours of the day. The hour of 8 P. M. is hit off to a nicety by the crowds on their way to the theatres, and the hour of 11 P. M. is as well defined by their return. Even the small hours of the morning are indicated by the movements of street sweepers, milk wagons, and men of half a dozen early morning trades. New York is a clock dial of itself and the movements of its inhabitants proclaim the hours as loudly and to the sympathetic ear as musically as any sounding gong.

WHO INVENTED THE THIMBLE?—The Dutch have always claimed the credit of having invented thimbles, and by tacit consent their claim was allowed up to a few years ago, but, unfortunately for the reputation of the Holland tailors, about the middle of this century, the antiquarians delving in the ruins of Herculaneum, uncovered a jeweler's shop, and found half a dozen gold and silver thimbles of the most improved modern patern. Since then several thimbles have been discovered in the Egyptian catacombs, in mummy cases antedating the Christian era fifteen to eighteen centuries. So how old is the thimble, or by whom it was invented, are questions that cannot be answered. The name is believed to be a perversion of thumbell, as the thimble was formerly worn on the thumb. The manufacture of thimbles was introduced into England from Holland in 1695 by a metal-worker named John Softing.

AMERICAN SHOES.—Special Examiner Hyer of the Patent Office has just returned from a tour of inspection through the great boot and shoe factories of Lynn and Haverhlil, in Massachusetts, and says that it is wonderful how machinery is now utilized to produce the output in this country. With the aid of one ingenious device one man can sew together soles and uppers for 450 pairs a day. On what is known as the standard nailer a single operator can nail 300 pairs, the machine making its own nails by wire, pointing them, driving them and at the same time automatically regulating the length of each nail to the thickness of the sole. With loose nails or pegs one person can do 600 pairs a day, though the toes and heals must be made additionally secure afterward. One pegging machine will peg two pairs of women's shoes per minute, cutting its own pegs from strips of white birch at the same time. A thousand cords of wood are cut into shoe pegs every year into the United States. All machines for sewing shoes are of American invention. The last census showed that the manufacture of boots and shoes was the greatest single industry in America, employing the largest amount of capital and the greatest number of individuals. The employes of the trade are about equally divided as to sex.

"No baking powder is gaining public favor so rapidly as Cleveland's."

One reason is people like to know what they are eating, and the composition of Cleveland's baking powder is given on every label.

So many baking powders containing ammonia or alum are widely advertised as "absolutely pure," the best way is to refuse any brand the composition of which is concealed.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of 'Book for Advertisers," 368 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. INSTRUCTIONS TO SUBSCRIBERS.

The Names of all Subscribers are registered as soon as received, and paper is always promptly forwarded.

Postage.—The postage to all parts of the United States and Canada is paid by the publisher.

Remittances of small sums may be made with comparative safety in ordinary letters. Sums of one dollar or more must be sent by registered letter or P. O. money order, otherwise we cannot be responsible for same. Silver must not be sent in a letter.

Postage Stamps will be received for the fractional part of a dollar, and in any amount when it is impossible for patrons to procure bills, but you must send one or two-cent stamps only.

SUBSCRIPTIONS.—The AMERICAN ANALYST will be sent one year to any subscriber for ONE DOLLAR. New subscriptions can begin at any time.

We Stop the Paper at the expiration of the time paid for unless a renewal of subscription is received. Those whose subscriptions have expired must not expect to continue to receive the paper unless they send the money to pay for it.

Change of Address.—Subscribers wishing their addresses changed must invariably give their former as well as new address.

Missing Numbers.—It occasionally happens that numbers of our paper sent to subscribers are lost or stolen in the mails. In case you do not receive any number when due, write us a postal card and we will cheerfully forward a duplicate of the missing number.

Most Important of All.—In every letter that you write us, never fail to give your full address, plainly written—name, post-office, County and State.

Address all letters to

MONROE ERASER MFG. CO., LA CROSSE, WIS.

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

Manufactured by E. McILHENNY'S SON,

NEW IBERIA, LA.

For Sale by all Wholesale Grocers.

NATRONA BI-CARBONATE OF SODA.

ABSOLUTELY PURE.)

The nature of the raw material from which NATRONA BI-CARBONATE OF SODA is made—viz., kryolith, a mineral containing *pure sodium*—insures a purity and uniformity of product which cannot be obtained from any other known material. In making BI-CARB. SODA from any other raw material, the use of sulphuric acid is a necessity, but none is used in any part of the process of making NATRONA BI-CARB.; hence its entire freedom from the slightest trace of arsenic, which is always present in ordinary soda. Its absolute purity and entire freedom from all traces of *sulphate of soda*, common salt and other impurities, render NATRONA BI-CARB. NEARLY TASTELESS, and being bolted through the finest bolting-cloth, insures the finest stage of division.

To these indisputable facts the attention of CONSUMERS of soda is specially called. They are IMPORTANT, and should influence both those who use and those who sell soda, to buy and sell NONE BUT THE BEST.

The NATRONA BI-CARB. Soda is kept in stock by almost every wholesale druggist and grocer throughout the United States, of whom it may be ordered.

Natrona Bi-Carb. Soda is unequaled by any other brand of English or American Manufacture.

BOOKS AND DISEASE.

Seldom do we stop to think, on taking a book from a public library, who might have handled the volume last. Books are lent out, and go from family to family, no attention being paid to the fact that they may have been handled by a patient having a contagious disease. The *British Medical Journal* mentions a case where a physician recognized in the house of a patient suffering from scarlet fever a book which he had noticed a few days before in the room of a former patient suffering with the same disease. On inquiring, he learned that a few days after borrowing the book the symptoms of the second case appeared. The paper used for covering library books soon becomes roughened, and undoubtedly furnishes the means of transmitting infectious diseases. Libraries should be notified, either by the boards of health or by attending physicians of cases of infectious diseases.

MEETING OF MILITARY MEDICAL MEN.

We have received from the Committee of Arrangements a circular announcing that the second annual session of the Association of Military Surgeons of the National Guard of the United States will be held at St. Louis, April 19th, 20th and 21st, 1892. An interesting programme of addresses by prominent surgeons of the National Guard and the United States Army has been arranged, and a goodly number of scientific papers on military and accidental surgery will be read and discussed, and all matters pertaining to the health, usefulness and welfare of the civilian soldiers will receive attention. The afternoon of one day will be set apart for an object lesson from the "Manual of Drill" by Hospital Corps of the United States Army, detailed for this purpose. This will be, without doubt, a very important, as well as instructive, feature of the session. The evenings will be given up to entertainments, receptions and banquets, which the medical profession and generous citizens of St. Louis have planned for their distinguished guests. The Committee of Arrangements have received the assurance that transportation will be satisfactorily reduced on all railroads and steamboats to and from this meeting. The several hotels have promised a low and uniform rate, which will be announced at an early date. It is anticipated that no fewer than five hundred surgeons and assistant surgeons of the National Guard of the United States will be in attendance, to all of whom the Committee of Arrangements will extend a most cordial welcome.

AUTOMATIC SERVICE.

We read in our electrical exchanges that an invention is being perfected for the extinguishment of fires by an automatic electrical appliance, which will probably relieve fire departments in cities from much of their present labor, and also save vast amounts of insurance. The process is thus described: "The building is provided with a chemical reservoir, from which pipes lead to a jar of acid near the ceiling of each room. The jar also contains a cartridge connected with an open circuit battery. The thermostat in each room is set at any desired point—say 80 degrees—and in case of fire the mercury rises to that point and closes the electric circuit. This explodes the cartridge, a valve drops, the chemicals are precipitated into the room, and the number of the room is signaled. This arrangement is supplemented by a series of dry pipes, and in case the chemicals fail to put out the fire the room can be flooded with water by turning a cock on the outside of the building." The advantage of such appliances would be very great in hotels, factories and other buildings where many people are employed. Elsewhere we are informed that a London electrician has invented an electrical device for delivering parcels from stores to houses throughout the city by a little electric railway with two tracks, one above the other, to be laid under the streets in a tunnel about two feet wide and three feet high, with side tunnels branching into the houses of subscribers. "To send a parcel a signal would first be given the central station for a truck. This would be quickly received, when the parcel would be placed upon it and the truck returned to the central station to be dispatched from there to the subscriber designated. The truck would be unloaded automatically, a bell signaling the arrival of the parcel." What an array of such inventions will be exhibited at the World's Fair, and what a revelation is in store for all who are able to visit that tremendous aggregation of the triumphs of genius and skill. The exhibits made by Prof. Edison at the last Paris Exposition were among the most wonderful seen in that renowned display of the world's products, but the coming exhibit at Chicago will overshadow anything of the kind ever witnessed in the history of nations.

ELECTRICITY AT COLUMBIA.

The trustees of Columbia College have established a new course of four years in electrical engineering for the undergraduates of the School of Mines. This is in addition to the present two year post-graduate course, which has been in successful operation for several years. Thus there will be two complete courses in electrical engineering in this city. The latter course is for graduates of scientific schools and colleges, and is entirely devoted to electrical engineering proper, the students having already passed the necessary preparatory studies in mathematics, physics, chemistry, mechanics, drawing, etc. This course is found to give the most excellent results, by reason of the mature years and previous training of post-graduate students. In addition so such graduate students there are, of course, a large number of young men who wish to enter a course of electrical engineering immediately on leaving school, without going through a previous collegiate course. The new four-year course has therefore been established parallel to the regular course in mining engineering, civil engineering, chemistry, architecture, etc., at the School of Mines, with the same requirements for admission, which are equal to the regular entrance examinations at first-class scientific schools. The first two years of the new course will cover the preparatory work of mathematics, physics, etc., required for admission to the post-graduate course. The last two years will be devoted to a thorough course in electrical engineering proper and will be equivalent to the present post-graduate course; hence there is no lowering of standard. The degree given to those who satisfactorily complete the course will be that of "Electrical Engineer." The new course will begin in October, 1892. Examinations for entrance will be held in June and September. The one-year partial or special course will be abolished next year to make room for the students in the regular courses.

READ PAGE 621.

DRESS.

ITS HISTORICAL, ARTISTIC AND HYGIENIC RELATIONS.

A chapter of exceeding interest might be written on the evolution of dress from the earliest times, but for this we have no opportunity at the present. The costumes of the Saxons and Normans differed widely. The Norman ladies wore their dresses tightly laced to them, while the Saxons wore theirs loose. The religious satirists of the day accused the Normans of painting their faces and tightening their waists. This now brings us to a subject of which we must speak with awe and bated breath; this is the origin of that much abused article of female attire known as stays. Terence, the Roman dramatist (born about 195 B. C.), makes one of his characters—speaking of ladies—say that "they saddle their backs and straitlace their waists to make them well-shaped." While other writers of the same period tell us that Roman women, whether married or unmarried, used wide girdles of stiff stuff, under which was a tight bandage fastened at the shoulder. This was, however, intended to support the bust and not to compress the waist. At the British Museum is a MS. of the time of Edward the Confessor, adorned by a picture of the Fiend of fashion, and this figure wears an unmistakable corset tightly laced and stiffened by two busks in front, just like the garment worn by Swiss peasants at the present day. In the ancient writings, too, a slender waist is spoken of as a sign of beauty. Even Chaucer speaks admiringly of a woman with a waist like a weasel. Now, however, we come to more sensible times. In the fourteenth century, Joseph, Emperor of Austria, a noted autocrat, passed a law forbidding the use of the corset in all nunneries and places where girls were educated. He also called in the Church to help him, and to excommunicate all those who wore the accursed garment. The College of Physicians, startled into activity by the imperial anxiety, produced numberless learned dissertations on the evils of wearing corsets, and distributed them broadcast through the land. Catherine de Medicis was of quite an opposite way of thinking, and to her a broad waist was an abomination, and it is said that during her reign waists were about thirteen inches in circumference. As well as introducing the artistic and becoming Medicis collar, which we all know so well, she also invented a corset herself, which at first glance might be taken for an instrument of torture of the holy Inquisition. It is made of steel as strong as armor, cut into open work pattern, over which velvet was sewn. It had two parts like a warrior's back and breastplate, on two hinges, and fastened at the other side with a pin like an ordinary box. At the front and back were two bars of steel, from which the dress hung. Considering this there is no wonder that our ancestresses looked stiff and uncomfortable. Whalebone stays were first used in the time of Elizabeth. James the First was so well pleased with them that he ordered all his courtiers, male and female, to wear them. The corset has never been absent from female attire since the time of Elizabeth, in spite of all the dress reformers. In Charles II.'s time the dsesses were very low, of Dutch origin. The skirt was tied back and an apron worn. This fashion was brought from Portugal by Catherine of Braganza. In Anne's time a curious eccentricity was seen in muffs being carried by men. The hoop was worn at various periods from the time of Elizabeth, when it was called a farthingale. It was always inconvenient and was never worn in a carriage. It has existed in our day in the hideous crinolines, and to some extent as a crinolette, and even the so called dress improver is a survival of it. In George III.'s time it was usual to have the head shaved to wear a wig, but occasionally têtes, as they were called, were built up on the head; as dressing these was a long and expensive process, they were left untouched for a long time. A writer describes a visit he paid to his aunt; while he was there the hair-dresser came and examined the huge tête and asked when it had been last refreshed. "Only nine weeks ago," said the old lady. "Well, that is about as long as it can be in hot weather," replied the artist. The writer goes on to describe the proceedings, which are too disgusting to repeat, as may be imagined from the hair being left for two months without the head being washed. In 1775 arose a curious club called the *savior vivre* club, which prided itself on its introduction of foreign cookery into London, in opposition to the Beefsteak Club. One of their dishes was macaroni, and the club came to be called the Macaroni Club. The members were the extreme dandies or mashers of the time. On the head was a toy cocked hat, gold laced, buttoned and tasseled, over the hair fashioned into a foretop two feet in height above the head, with numerous side curls and clubbed tail. He wore tight, striped silk breeches, equally tight coat and waistcoat, gorgeously embroidered, which kept his frail figure together. He carried a long cane, such as Lord Mayors' footmen now bear. He wore a watch in each fob and a pound of seals hanging out. The macaronis rode out in the park on little ponies, and this is the allusion in "Yankee Doodle." The female macaronis had their heads top-heavy with hair, on the top of which they wore toy windmills, ships, coaches and four, &c. Their dress was as tight as the men's, and they dragged after them a long train, giving them the appearance of a wheeling crocodile. The ladies of the regency were dressed in most plain fashion, as owing to the war with France we were cut off from French modes. They wore straight pelisses of striped silk—summer and winter alike; the gowns were very thin and were trimmed with tawdry ribbons. In George IV.'s time we see a revulsion to the hoop, and the women were dressed in high waists and long, straight gowns. At the early part of this century the dress was most extravagant. The ladies' skirts were short, and both sexes wore enormous hats. From that time the present dress has been steadily developing, the only important change in men's dress having been the alteration from knee breeches to trousers. As many of you will remember, about 1850 to 1864 or so, crinolines were worn. Then arose a craze, of which you have heard, of making the Bloomer costume general. Theoretically, it is a good thing to get rid of the heavy skirts, but it requires great care in introducing reform, that they are not repulsive; this the Bloomer was, and was so heaped with ridicule that it quickly died. After the crinolines went out, the fashion again went back to the plain straight skirts; the clothing then became exceedingly tight, this was followed by the crinolette, and now we have swung back to the plain skirts, without, I believe, so much as an "improver." It is now not only possible, but excites no comment, for any woman to be dressed according to present fashion, and yet in obediance to the laws of nature and art. The closely fitting dress shows to the best advantage the graceful curves of the figure, when not tightly laced, and in the case of head and foot covering there is perfect liberty for any sanitary methods. The colors, moreover, are decided ones, and far removed from the ugly shades seen a few years ago, and misnamed "Art colors," during the æsthetic craze. Fashions in men's clothing have changed but little; attempts have been made to alter the present style, but fruitlessly. The Prince of Wales tried to introduce colored coats for men, and began with bottle green, but the fashion did not last long. The Rational Dress Association also agitated for more reasonable dress for men, and exhibited specimens of dress, all on the plan of shorter coat and knee breeches. For evening dress black velvet was suggested, but did not meet with any favor, as we English are perhaps too conservative; when we have a bad thing we like to keep it to the last. Still, in looking back, we can see a steady improvement in dress in many ways, but more especially in the manner in which children are dressed, the little ones being much more carefully attired now than formerly. We may now glance for a moment at the æsthetic requirements of dress. A dress to be beautiful (as all dresses should be) must be true to natural lines, should harmonize in style and color, fulfil its proper purposes, and be free from shams. Now, as I have before remarked, if the dress, according to the present style, were not so constricted at the waist and lower ribs there would be no fault to find, as with this exception, the lines are good. But, even if the pressure did not do harm, the sharp angular lines and abrupt curves, instead of a flowing, graceful one at the hips, would be quite sufficient to condemn it from an artistic point of view. It is of course objected that, with the skirts such as English women are obliged to wear, a smaller waist is necessary than in a nude or draped figure. There is some reason in this, but it is by no means necessary to make seven or eight inches difference, and, moreover, if it is artificial or untrue it cannot be good art. It it were only the custom to have a normal waist of twenty-six or twenty-seven inches, no one would consider it at all clumsy or ugly; in fact, quite the contrary, for all kinds of deformities, such as high shoulders, crinolines, crinolettes, and so on are not only tolerated, but even admired by the devotees of fashion so long as it can be said that they are "as now worn." The whole body from neck to arms and feet should be clothed in wool or silk next the skin. Over this should be worn a bifurcated vesture, which by courtesy may be called a "divided skirt." Of this the best form is that reaching only to the knee—practically knickerbockers made of cloth, serge, or flannel. Woollen stockings and in winter cloth gaiters should cover the lower extremities. No garters should be used. Then comes a lightly fitting (not compressing) corset, without bones or steels, and not made of too stiff material, with a waist measurement of not less than twenty-six or twenty-seven inches for a woman of average height. Over this is worn a bodice and skirt in one, or an ordinary bodice with the skirt suspended either by ladies' braces or, better still, by a broad band shaped to the hips. No other skirt is needed, and the ordinary dress can then be worn as usual. The collar and armholes should not be tight, as the circulation is often impeded by clothing too tight in these situations. I do not suggest that women should be without any kind of corsets, as some garment of the sort is necessary to insure the proper fit of the dress and to give support to the bust. It has been asserted that to look at a woman one would imagine her to be a "one-legged animal," and that, therefore, her garment should be divided. I do not consider this any serious argument, but in any case the custom of centuries has habituated us to seeing women as they are, and so long as no harm is done by a custom, it is best left alone, especially as the time is not ripe for any change. As above mentioned, it is not necessary to go without stays altogether, but steels and bones should be avoided as useless and dangerous. The cry of the women with regard to the corset is always that it is a "support;" but women have the same muscles as men, and if they gave them free play, as men do, instead of fixing them in hard splints, they would not need any outside aid to hold them up. Girls who have never worn corsets do not require any support; on the contrary, are more erect and graceful than the majority of women, and retain their good figure longer than those who think to improve upon nature by the aid of the staymaker. This is at all events the thin end of the wedge toward a better state of things, which we ought all to hope for. The scanty clothing of the lower limbs predisposes to chills and all that follows thereon; while the petticoats assist the stays in their work of pressure. They also keep the pelvis hot, and leave the limbs cold, while preventing free walking by their clinging weight. The stiff garters interfere with the circulation of the limbs, causing varicose veins, consequent skin disease and ulcers of the legs. There is no doubt but that lawn tennis and other healthy outdoor exercises for girls have done much toward ap-

preciation of a better form of clothing, but much, very much, remains yet to be reformed, and for this we must trust in the higher education of women. Of course I know perfectly well that no women ever admit that they tight lace; that would, indeed, be too much to expect; and they practice a little trick to "do the doctor," which has been shown by Doctor Roth. If any lady is remonstrated with as to the compression of her waist and chest, the invariable reply is: "Everything is quite loose; I can get my hand inside the corset easily." Naturally this is most simple, for by bending the body slightly, and breathing out, the size of the chest is still further reduced. The true test is to remove the corsets, let several deep breaths be taken, then, while an inspiration is held, attempt to fasten the dress. It will be found to be several inches too small if there be any compression. It does, however happen that the bony framework of the chest is already fixed in the deformed position, when the test is not quite so successful. Then, again, women tell us that they don't feel the pressure; this is probably true, as the compression is begun at such as early age, when the ribs are soft and easily moulded, that the procedure is painless. That this is intentionally begun early can be seen by referring to the advertisement sheets of a certain ladies' paper, where corsets for young girls are recommended, "in order to mould the figure."—*From a Lecture by Dr. A. Charpentier.*

DECEPTIVE GIFTS.

STEM-WINDERS THAT ARE NOT WATCHES, AND OTHER DELUSIONS.

The subjoined lively description of a species of fraud which THE AMERICAN ANALYST has several times had occasion to expose, is from the *New York Recorder* of December 13th. The swindle is a common one, and has been so thoroughly ventilated that it seems remarkable that any person at this day could be victimized by it. If people would only bear in mind that no matter how speciously they may be advertised, articles of standard worth always command prices proportionate to their value, pretenders of the kind described below would be speedily forced to abandon their nefarious callings: "Many confidence games have from time to time been sprung on an unsuspecting public, all of them being of a more or less ingenious nature. Great companies have been organized, and when thousands of dollars had been paid in by unsophisticated countrymen, and even unwary New Yorkers, who ought to have known better, the bubbles were pricked, and groanings and lamentations were heard on every side. However, it remained for a man, who calls himself F. I. Gray, to evolve a scheme which in its conception and brilliancy surpasses all others. It is just such a scheme as would cause 'Grand Central Pete' and 'Hungry Joe' to raise their hats in admiration of their superior. These two worthies plied a trade which finally put them behind prison bars. Mr. Gray's methods, although sure of reaping a rich harvest, were of a safer kind—so safe, in fact, that he can laugh defiantly at the law—for although on the very face of it the scheme is apparent, he really does nothing but what he publicly advertises. Mr. Gray, until a few months ago, ran a periodical known as the *Household Companion*, but for the reason, apparently, that he was not making money fast enough, he sold out his interest in the business. He disappeared from the public view for some time, but on September 1st he appeared again with the scheme of his life. Renting a couple of rooms at 7 Murray Street, he put up a sign announcing that they were the offices of the *Farm and Household*, and beneath was inscribed the words 'F. I. Gray & Co.' Who the 'Co.' is no one at the office seems to know. The offices had scarcely been rented when an advertisement was inserted in over one hundred papers, soliciting subscribers for the *Farm and Household*. No announcement was made in any metropolitan daily, but weekly and monthly periodicals, that circulated among the rural population and in distant cities, contained the advertisements. They were couched in the most glowing language, and, in order to gain subscribers, gold watches, miniature suites of parlor furniture, and other articles were practically promised to each one. The advertisements were gems of art in their way, and it is estimated that thousands have already been caught in the gorgeous trap. One specimen, for example, fairly scintillates with Dr. Gray's genius. It was published in double column, with two pictures of gold watches, and had the startling headline 'Gold Watches Free.' Another astonishing offer appeared in an advertisement giving pictures of an upholstered parlor set of three pieces, for which any second-hand dealer would give at least $100. Beneath the picture was a statement that 'this beautiful miniature upholstered parlor set' would be sent to any address on receipt of 95 cents to pay expenses, boxing, packing, advertising, etc. After explaining that the set consisted of the sofa and three chairs, and that the offer was simply for the purpose of advertising the *Farm and Household*, the advertisement went on to say, 'They are made of fine lustrous metal frames, beautifully finished and decorated, and upholstered in the finest manner with beauful plush (which we furnish in any color desired). To advertise our house, for sixty days we propose to furnish these sets on receipt of 95 cents. Postage stamps taken. No additional charge for boxes or shipping. Order immediately. No attention paid to letters unless they contain 95 cents.' There was only one inference to be taken from the advertisements—that a gold watch, as pictured, was to be given away on some terms explained only in the *Farm and Household*. Second, that a stem-winder watch was to be given away for one dollar's subscription, and that a parlor set would be given away for 95 cents. As a result, subscriptions began to arrive at a terrific rate. The stem-winders were forwarded, then complaints arrived, and the scheme was stamped as a fraud. In order to prove this latest wrinkle in the advertising line, a *Recorder* reporter climbed to the fourth floor of 7 Murray Street yesterday, the hall directory showing that the office of the *Farm and Household* was No. 34. The office was divided into two apartments by a partition, a narrow door connecting both. Room 34 was barren of furniture save a small desk in one corner. Over the narrow door leading to the inside room was the forbidding sign 'No Admittance.' A twelve inch window or aperture in the partition enabled one to see that the inside room was also destitute of furniture save for the heavy benches running all the way round, and a few chairs. On the benches, piled several feet high, were thousands of little boxes, into which half a dozen young girls were packing the watches for presentation to the subscribers. One of these girls, who had apparently charge of the office, walked quickly into room 34, and, after carefully closing the door, asked the reporter his business. On being informed that he wanted to see one of the stem-winder watches advertised for a dollar's subscription, she replied, with a smile, 'Oh, you are mistaken. We do not advertise watches for one dollar; we only advertise stem-winders. See?' The reporter saw. In fact, he began to become enlightened. Then he asked to see the stem-winder mentioned, and was shown an article that had all the appearance of a gold watch, both in size and shape. Close inspection showed that the case was made of base metal, but as he did not expect the earth for a dollar, he expressed no surprise. Then, pressing the spring, he began to examine the works. When the face of the watch was disclosed the girl laughed, but the reporter became dazed as he realized the brilliancy of Mr. Gray's mind. It was simply a sun-dial. Across the face ran a little bar of steel, from which ran an upright wire. 'You work it this way, see?' she said, as twisting the stem-winder, she made the little steel bar turn in every direction; 'then you hold it up to the sun, and, wherever the shadow of the wire falls, that is the time of day.' 'But are there no works of any kind?' 'No; ain't there works enough there for you? What do people want for a dollar, anyhow?' The reporter asked if any gold watches were given away at all, and she said yes, but only on the terms given in the *Farm and Household*, a copy of which she produced. It was stated in the latter that a $25 gold watch would be given away to anybody organizing a club of twenty-five subscribers—in other words, for $25. She showed the watch, and it certainly was a watch, and probably cost, wholesale, $7 or $8—perhaps less. The reporter then asked to see the 'miniature upholstered parlor set,' and she produced a pasteboard box about five inches long, two inches high and two inches wide. Taking off the cover she disclosed three little toys, upholstered and framed as stated in the advertisement. At wholesale they would probably cost about four cents each. 'You see, we don't offer a parlor set,' she explained, 'only a miniature set, and there it is.' Perhaps the funniest part of the whole scheme is the periodical itself. The family paper, each issue of which 'is beautifully illustrated, containing stories of fascinating interest, and a rich variety of funny sketches, anecdotes, news, condensed notes on fashion art, industries, literature, etc.,' is got out by what is known to printers as a 'boiler plate factory.' From the first page to the last (and there are sixteen pages altogether) it is 'plate' matter. Nothing whatever is set up save a few lines on the 'editorial' page. A competent printer, who inspected the paper, is authority for the statement that $60 would more than cover the cost of getting it out each month. In case any one is foolish enough to send $25 in subscriptions, and gets a 'solid gold' watch, Mr. Gray and the 'Co.' will have a clear profit of about $18. On the stem-winders the profit will be about 95 cents, and on the miniature parlor set at least 75 cents. Against this is the cost of getting out the paper—about one cent each copy. 'Is Mr. Gray not afraid of getting into trouble over such a scheme as this?' asked the reporter. 'By no means,' was the reply. 'We do all that the advertisement calls for, and what more can any one expect?' 'How about complaints? Do you receive many from your subscribers?' 'Yes, we do receive some,' was the reply, 'but then we do not mind them. By-the-way, won't you please tell me who you are?' 'Certainly;' and the reporter informed her. Before she had time to recover from the shock he had made his escape. Mr. Gray was invisible during the interview."

URUGUAY VINEYARDS.—At Santa Rosa, in the Republic of Uruguay, 200,000 vine shoots were planted this year. Next year there will be twice as many planted. They grow luxuriantly, and bear abundantly in that part of Uruguay, and are profitable to their owners.

NO FEATHERS.—Some time ago several women in England started a society, the members of which bound themselves "to refrain from wearing the feathers of any bird not killed for purposes of food, the ostrich only excepted." The society grew very greatly in numbers, and its good influence is shown by the letter of a professional fowler to a newspaper. A year ago he says he was asked to get 8,000 Kittiwake gulls, but this year he has not shot one. The gull is a beautiful and useful bird, and the fashion of wearing its plumage seriously threatened its extermination.

EXPENSIVE COLLECTION.—An Augusta, Me., man bought a machine from a Boston firm, and soon had occasion to send for a small spring to replace one that became broken. The spring came along, followed by a bill—two cents for the spring, two cents for the postage—a total of four cents. It cost the firm two cents postage to send the bill, the Augusta man paid two cents more in sending the money, and then the Boston concern expended another two cents in sending a receipted bill, so that, all told, it cost six cents to collect two.

BRIGHT STORIES.

THE ROBBER OF PIROCHE.

By Alexander Dumas, Fils.

Do you know Piroche? No? Neither do I; therefore I will not abuse your confidence by describing it. Then descriptions are always tiresome—I prefer to leave them to the imagination of the reader. It gives him something to do, flatters him, makes him think if he can do so much he can do the rest.

We all have a gallery of pictures in our minds and hearts, either of sunshine or of shadow or valley, sea or plain, which will serve for any story ever written.

Thus, I will only say that at the moment when this story I am going to tell you commenced it was midday in the month of June, and the road we are going to travel was bordered on the left by tall reeds, on the right by the sea. It is useless to say the sky was blue, the sea brilliant, rolling in long, lapping waves, and the road hot and dusty.

I will only add, this road wound along the coast of Bretagne from 'Poterie to Piroche, a little village like all other villages of that period, and two peasants, father and son, mounted on two asses, were trotting along this road very comfortably for the asses as well as the peasants.

"Will we get there in time?" said the son.

"Yes, it is at two o'clock," replied the father, "and the sun now marks a quarter to twelve."

"I am anxious to see it," said the son.

"Yes, I can well believe you."

"Will he be hanged with the armor on?"

"Yes, I am told so."

"What in the devil made him think of stealing a suit of armor?"

"It is not so difficult to think of as—"

"To do," interrupted the son, who wished to have his share in the joke. "Was the armor very handsome?"

"Magnificent—steel inlaid with gold."

"Was he taken in the act of carrying it off?"

"Yes; you understand the armor could not be moved without a terrible clanking, and the noise woke up everybody in the chateau."

"Then they caught him?"

"Not at all; they were afraid."

"Naturally—people are always afraid in the presence of robbers; without that there would be no advantage in being a robber."

"No; but these people didn't think he was a robber."

"What then?"

"A ghost. The rascal carried the armor in front of him, holding it high above his head. It looked like a gigantic giant walking through the corridors; besides, the scamp made a hoarse, groaning noise behind it. You can imagine the fright of the servants, but unfortunately for him it aroused the lord of the chateau, who was afraid of neither the living nor the dead; he arrested the robber and handed him over to the proper justice."

"And the proper justice?" interrupted the son.

"Ordered him to be hanged in the armor he had stolen."

"Why was that clause in the judgment?"

"Because the Lord of Piroche is not only a brave soldier, but a man of wit and intelligence. You know everything that belongs to a hanged person becomes a talisman of good luck to those who possess it; that is why the Lord of Piroche ordered him to be hanged in the armor. After death it was to be returned to him. He wanted it as a talisman in the next war."

"That was ingenious."

"Yes, I should say so."

"Come, let us make haste; I am anxious to see this hanging."

"We have plenty of time; don't fatigue our beasts, for we must return home to-night."

Thus father and son chatted, and in half an hour they reached Piroche.

As the father said, they were in time (fathers have the privilege of always being right). There was a great crowd in the grand place in front of the chateau, where the scaffold had been erected—a beautiful gibbet placed upon it of superb oak wood. Ma foi, it was rather low, but then it was for a low, degraded criminal, yet sufficiently high for the rope to do its deadly work, twisting and turning in the breeze like a thread from a needle. The criminal was going to have a beautiful view in his last moments, if that would be any consolation to him, which I very much doubt. A soft, azure sky, a calm, silvery sea on which a white sail was gliding like an angel flying toward heaven, its long white robe still touching the earth it was leaving.

Our peasants approached the scaffold as near as possible, so as to see all that passed, and waited with the others, having the advantage of being mounted on their asses, where they could see better and with less fatigue. They had not long to wait. At twelve o'clock precisely the door of the chateau opened and the prisoner appeared, preceded by the guards of the Lord of Piroche and followed by the executioner.

The robber was dressed in the armor, mounted upon an ass, his face turned to the tail of the beast and his hands bound behind him. The visor of the armor was lowered so one could not see his face, but you can imagine he was ill at ease and a prey to very sad reflections. They brought him in sight of the gibbet. It was not a pleasant picture outlined against the blue sky.

The executioner placed his ladder to the scaffold, and the chaplain of the Lord of Piroche mounted the stage and began to read the sentence of death. The prisoner never budged; one could have imagined he had played the trick of dying before hanging. They ordered him to dismount from the ass and deliver himself to the halter. He never moved a muscle. We can well understand his hesitation.

Then the executioner took him by the elbows and lifted him to the ground. What a strong old fellow this executioner was! In the meantime, the chaplain had finished reading the sentence, and turning to the criminal demanded:

"Have you anything to say?"

"Yes," replied the miserable wretch, in a low, stifled voice. "I beg for mercy and pardon." This seemed a good joke. The Lord of Piroche shrugged his shoulders and ordered the executioner to do his work.

He tried to make the criminal ascend the ladder, which was not an easy thing to do. It is strange how these people condemned to death will make such a difficulty of dying. The executioner had to resort to the same means he had employed to make him descend from his ass—he took him by the arms, placed him on the third round of the ladder, and pushed him up, amid the "bravos" of the crowd.

Then the executioner placed the running knot at the end of the rope around his neck, and giving him a vigorous kick in the back launched him into space, or rather into eternity. A great shout and shiver ran through the crowd, the condemned balanced two or three minutes at the end of the rope, kicking and twisting as it was his right to do, then hung stiff and motionless.

The crowd regarded him a few moments, the burnished armor glistening in the sun; then they broke up into little groups and departed homeward, all talking of the event.

"Ma foi," said the son of the peasant to his father, "to be hanged for carrying off the armor when he did not get it seems hard. What do you think?"

"I was just asking myself if he had really carried off the armor what would they have done to him? No matter; he has been punished justly, no doubt, but it was not a pleasant thing to see."

Twenty minutes after they entered the village of Piroche, where they expected to rest a few hours and start back late in the evening so as to reach home that night.

Next morning at peep of day two guards came out of the chateau to unhook the dead body and take off the armor of their lord. But they found what they least expected. There were the gibbet and the rope, but where was the body? They rubbed their eyes, thinking they must be dreaming. No, it was really true—there was no body—naturally no armor.

This was very extraordinary; the rope was neither cut nor broken, but just as it was before it received the criminal.

The guards ran to announce the astounding news to their Lord of Piroche, who would not believe them. He must see the fact with his own eyes. He was such a powerful personage he was certain he would find the hanged just where he had ordered him. On reaching the scaffold he was forced to believe as the others. What had become of the dead body? He was surely dead the evening before—hanged in the sight of the whole village.

Perhaps another robber, profiting by the darkness, had carried off the armor, but then he would have left the body, which he evidently had not done.

Perhaps some friends or relations had given the poor wretch Christian burial; but that was improbable, as he had neither friends nor relations; besides, people of such Christian instincts would have taken the body and left the armor. It was all extraordinary they knew not what to believe.

The Lord of Piroche was so troubled at the loss of his armor that he offered a reward of ten gold pieces to the one who would bring back the criminal clothed in his armor. No one appeared. They searched in every direction; found nothing.

Then they ran to a wise man in the city of Rennes, and placed this question before him:

"Can a man hanged by the neck until he is dead escape from the rope that strangled him?"

The wise man demanded eight days for reflection; then he answered "No."

Then they placed another question before him.

"Can a robber hanged for a theft committed during life steal after death?"

He answered "Yes. They demanded how this could be. He replied, "I don't know, but it is true." Now, he was one of the wisest men of his age. They then concluded the robber was a sorcerer. Masses were said to drive away the evil spirit, who would not only avenge himself on the Lord of Piroche, who had condemned him to death, but on all the people who had come to see him die. A month passed; the gibbet remained on the scaffold—gloomy, humiliated and scorned—for never had a gibbet betrayed a like abuse of confidence.

The Lord of Piroche continued to demand his armor from man, the Church, and the devil, but no one answered. He was about to resign himself to this strange event, and the loss resulting therefrom, when one morning he was aroused by a great noise in the place where the scaffold was erected. He started to learn the cause of the tumult, when his chaplain entered in great excitement, and cried:

"Monseigneur, do you know what has happened?"

"No, I was just going to see."

"Well, I can tell you—a miracle—a miracle from God."

"Indeed, what is it?"

"The hanged—"

"Well, what of him!"

"He is there."

"Where?"

"On the gibbet."

"Hanged?"

"Yes, my Lord."

"In his armor?"

"Yes, in your armor, my Lord."

"Ah, that is all right. Is he dead?"

"Stone dead, only—"

"Only what?"

"Did he have on spurs when he was hanged the first time?"

"No, of course not."

"Ah, my Lord, he has on spurs now, but no helmet—that is lying at the foot of the gibbet."

"Come, quick, M. Chaplain, let us go and see."

The Lord of Piroche ran to the place, filled with a curious, wondering crowd. Sure enough, there was the hanged, his neck securely fastened in the running noose, his body dangling from the end of the rope, dressed in the burnished armor. It was prodigious, wonderful. All cried, "A miracle!"

One said "He had repented, and returned to expiate his crime." "He has always been there," said another, "only we could not see him."

"But why has he on spurs?" asked a third.

"No doubt he was far away and wished to come back in a hurry."

"Ma foi! No need of spurs; if I had been in his place I should have never been in a hurry to come back."

Thus they laughed and chatted as they regarded the distorted features of the poor wretch. The Lord of Piroche did not mean to be cheated of his armor this time, so he ordered the body to be taken down, stripped and the armor carried into the chateau. This done, they rehanged the dead body, and the crows admired it so much that in two days it was pecked and mangled in slashes, in eight days it was in rags and and tatters, in fifteen days there was nothing left but the clean picked bones.

Now where had the hanged been in his month of absence? What had he been doing? Why had he escaped, and then returned to be rehanged? I will give you three reasons as they were told to me.

An enchanter said "that the criminal at the moment of dying had willed his body should disappear, should be absorbed by the mind, and as the mind was immaterial, invisible and impalpable, so the body became invisible and impalpable; but the will was not strong enough to produce an eternal absorption, therefore the body had become material and visible again." This was one version.

The theologians said "the criminal was a prey to the most terrible remorse, and not able to endure his agony had returned to expiate his crime." Not very plausible, still it was a Christian reason, and as good Christians we ought to accept it as far as possible.

Another version:—Our two peasants on their return home that evening passed by the gibbet and heard groans, prayers and entreaties. They devoutly made the sign of the cross and asked: "Who is there?" No one answered, but the prayers and groans continued and seemed to come from the dead body hanging above their heads. Then the son took the ladder left by the executioner and climbed up to the height of the criminal and said: "Is that you groaning, my poor man?" "Yes." "Are you alive?" "Yes." "Do you repent of your crime?" "Oh, yes." "Then we are going to take you down. The evangelist commands us to help all who suffer; you are suffering, therefore we are going to help you live and repent. For God loves a repentant soul better than a suffering body."

They took him down and discovered how he had escaped death. The rope instead of clasping his neck had caught on the rim of the helmet and held him suspended without strangling him, and thus he had been able to breathe until these peasants rescued him. They carried him home with them on one of the asses and handed him over to the care of the wife and daughter. He soon recovered; but he who has stolen once will steal again.

As there was nothing to steal in the house of the peasant but his ass and the daughter, the ex-hanged determined to take both; he coveted the beast, and was in love with the daughter, a fair blond beauty of 16. One night he saddled the ass, put on his armor and a pair of spurs to aid his flight, and attempted to carry off the girl in her sleep. She awoke, and her cries soon brought her father and brother; the robber tried to escape, but he was too late. When the young girl told of his infamous attempt, they knew he had not repented and were sorry they had saved such a miserable scoundrel, so they determined to execute justice upon him, but far better than the Lord of Piroche had done.

They bound him to the ass he had saddled, carried him back to the gibbet he had escaped from, and there hanged him till he was dead, taking good care to leave off his helmet this time, placing it at the foot of the gibbet. They then quietly returned home.

This is the third version. I don't know why, but I imagine it is the most reasonable and that you, like myself, will give it the preference over the other two.

As to my Lord of Piroche, having such an excellent talisman of safety he joyously departed to the next war and was the first one killed.

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEATS.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, duck, geese, turkeys, grouse, capons, hare, partridge, pheasants, rabbits, pea-fowls, guinea-fowl, snipe, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

PRACTICAL RECIPES.

PEANUT SOUP.—Shell enough nuts to fill a half pint cup and pound them up fine, add to them two heaping teaspoonfuls of flour and mix well, then add a pint of oysters; boil up and add a pint and a half of hot water and a red pepper cut in two. Boil up and serve.

CLAM FRITTERS.—Strain the juice from the clams, and chop them up fine. Beat up three eggs very light and stir them into the clams; cut up enough parsley to make a teaspoonful, and add it to the clams with salt, pepper and a little grated nutmeg; stir in a cupful of cream and slowly dredge with flour until it is the consistency of fritters. Have a pan very hot and put in it a mixture of half butter and half lard, let it boil, then drop in the fritter batter, a spoonful at a time; brown, drain on coarse brown paper and serve very hot. Use about twenty-five clams.

ROAST BEEF AND KIDNEY PIE.—Boil a kidney until perfectly tender. Take some cold roast beef bones and put them to boil in just enough water to cover them; cover closely. Add after a while two onions cut in small pieces, a lump of butter and enough browned flour to thicken it slightly, also salt and pepper. Cut up the kidney into small pieces carefully rejecting the tough part; cut up also about once and a half as much cold roast beef as kidney, into small pieces and add it with the kidney to the gravy; first removing the bones, boil up, then set away to cool. Make a rich biscuit dough, butter and line a baking dish with it, fill up with the meat, put on a top crust and bake in a good oven.

VEAL OLIVES.—Cut some slices of the fillet of veal half an inch thick and eight or ten inches long; put them in a dish; sprinkle over them on one side, a little pepper, salt and mace. Roll each piece separately and tie it securely; put them into a stewpan with a little water and butter, and simmer down to a brown gravy; they should be stewed for one hour; when done, dish them and strew fine cracker crumbs over them.

BREAD PUDDING.—Let a pint of milk come to the boiling point, then pour it onto a loaf of dry bread, and when soft beat into it the yolks of six eggs and the whites of three, well beaten; add two tablespoonfuls of flour, nutmeg, and one pound of raisins; boil two hours and serve with sweet sauce.

FRUIT CANDY.—Put three cupfuls of granulated sugar to boil with one cupful of cold water and a table-spoonful of vinegar. Seed a good cupful of raisins, and chop them up together with a cupful of blanched almonds and half a cupful of figs. Butter your pans and sprinkle the fruit thickly over them. When the candy is boiled until it crisps in cold water, pour it onto the fruit and set away to cool.

GOLDEN PUDDING SAUCE.—Cream up half a pound of butter with half pound of sugar; add the yolk of an egg and half a glass of wine, and some grated nutmeg; put it over the fire and stir until it begins to boil, then it is ready.

PRECISELY!—A woman is never so apt to wish she was a man as when she sees one get up from the table, and walk away without a backward look or thought of the dishes—*Atchison Globe.*

REASONING WOMEN.—If you will investigate you will find that the reason some women are superstitious about allowing thirteen to sit down at their table is that they have only a dozen knives and forks.

A SOUND RECOMMENDATION.—A most important feature of the scientific instruction in the lower grade of schools should be the collection of specimens which should form the subject of object lessons.—*Scientific American.*

AUSTRALIAN DEVELOPMENT.—The Australian city of Melbourne, which was founded less than fifty years ago, has already a population of nearly half a million, and stands fifth among the cities of the British Empire. It is now a great shipping port, and its slum quarter is small.

JAPANESE PREFERENCES.—The Japanese, it is said, dislike the Russians and the Chinese, but like the Americans and the English. They are fearful of the aggressions of the Russians in Corea and of the Chinese in the islands that lie south of Japan; but they do not look for any act of aggression by the United States or by England.

TO HARDEN IRON.—Ox hoofs and leather are soaked in French nut oil, and are then burnt, pulverized, and mixed with sea salt and potash. The following proportions are used: 30 per cent. of hoofs, 30 per cent. of leather, 30 per cent. of sea salt, 10 per cent. of potash. This product is said by the *Scientific American* to harden iron all through.

DEER-SKINS.—Though deer are not abundant in the markets, deer-skins may be bought at $1.75 to $2.50 each. An unusually handsome skin may cost $5.00. Taxidermists charge from $3.00 to $6.00 for curing them, and furriers charge as high as $25.00 for the cured hides. The hides of deer shot by pot hunters are often damaged with bullet holes, and are, therefore, cheap.—*N. Y. Sun.*

AFRICAN MAPS.—A missionary on the middle Zambesi, who has traveled over all that region, says the best maps of the country are very inaccurate; that rivers are laid down where they do not exist, and that numerous villages appear where there is not a trace of a human habitation. He says the maps are simply an aggravation to travelers, who are often put to inconvenience by relying on information which they find later to be inaccurate.

THE COLUMBIAN EXPOSITION.

THE WORLD'S FAIR LUMBER AND FORESTRY BUILDING.

The general plan and character of this original piece of architecture have been fully decided upon, the contract for its construction having been let September 24. It is shown in the accompanying engraving. The estimate cost is $100,000, taking into consideration the fact that a large part of the material and some of the work will be contributed. The size will be 200 x 500 feet, and the central height 60 feet. The following is stated officially, descriptive of the building: "It will be one of the unique features of the exposition architecture. Its interior appearance will be as natural as unhewed wood can make it. The pillars supporting the roof will constitute the principal feature of its architecture. They will consist of natural tree trunks from 16 to 20 inches in diameter and 25 feet long. Contributions of tree trunks from each State and Territory will be used. The sides of the building between the supporting trunks or pillars, will be filled in with slabs with the bark off. The window frames will be treated in the same rustic manner as the remainder of the building. The main entrance will be elaborately finished in different kinds of wood, the material and workmanship to be contributed by the woodworkers of the world." The building has been provided for out of appropriations for the architectural department, with which the department of lumber and forestry was merged, by authority vested in the management. When it was found that no direct appropriation had been made for the lumber and forestry exhibit, and that no special managerial head was to be provided, lumbermen all over the country were greatly disappointed; and finding himself placed in a peculiar and somewhat unfortunate position, without being himself responsible, Chief Buchanan set about to accomplish what he could for the lumber and forestry interests. He first engineered the lumber and forestry building through, and subsequently the sawmill building. The former will contain the entire government exhibit of lumber and forestry, with the exception of those things which may properly or necessarily be displayed in the open air. The exhibit will be general and international in its scope, the States and foreign countries all having space properly assigned for adequate representation. The rustic colonnade, which will set off the building, was decided upon a few months ago, and solicitations for tree trunks were early sent out to the different States and Territories. It was stated that the building would occupy a commanding position on the lake shore, and that it would be designed to illustrate in its construction and arrangement the forest wealth of the world. The architecture should be of a rustic character to produce a beautiful and appropriate effect. A prominent feature would be a wide colonnade along the front of the building, facing the lake, and across either end. The supporting columns were to be trunks of trees with the bark on, representing the characteristic woods of the various States and Territories, thus adding to the unique beauty of the structure, creating general interest throughout the country, and furnishing an opportunity for each State and Territory to exhibit specimens of its forest trees, and add character and attractiveness to the forestry exhibit. The trunks were to be from 16 to 20 inches in diameter, and the base tapering gradually, and 25 feet long. Each column should have attached to it by the exposition a tablet on which should be engraved the name of the State or Territory furnishing it, the name of the tree, and an estimate, if furnished, of the approximate quanity of such timber in the State or Territory. Each State board of agriculture was asked to send on the three desired representative tree trunks. Up to the present time a large number of the requests have received assurance or compliance, and while some of the State World's fair boards have not yet been organized, it is known that the rustic columns will be forthcoming in probably every instance. The original plan has been somewhat changed, however. The trunks called for in the letter of solicitation referred to above will constitute the centers of each column, which will be completed by the addition of two smaller trunks, placed one on each side. The colonnade will also be extended along the fourth side of the building, in all probability. Thus the States will be called upon for more than an average of three trunks each. The following list of trees has been suggested by Chief Fernow of the government forestry division, as leaders in a monographic display by different States:

Maine, white pine.	Kentucky, hickory.
New Hampshire, yellow birch.	Ohio, ash.
Vermont, sugar maple.	Indiana, black walnut.
Massachusetts, elm.	Illinois, white oak.
Rode Island, sassafras.	Michigan, beech.
Connecticut, butternut.	Wisconsin, red pine.
New York, black spruce.	Minnesota, basswood.
Pennsylvania, hemlock.	Iowa, post oak.
New Jersey, pitch pine.	Missouri, sycamore.
Delaware, soft maple.	North Dakota, canoe birch.
Maryland, chestnut.	South Dakota, box elder.
West Virginia, black cherry.	Nebraska, black locust.
Virginia, loblolly pine.	Kansas, catalpa.
North Carolina, short leaf pine.	Montana, mountain white pine.
South Carolina, cypress.	Wyoming, lodge pole pine.
Georgia, long leaf pine.	Colorado, Engleman spruce.
Florida, red cedar.	New Mexico, cottonwood.
Alabama, chestnut oak.	Arizona, bull pine.
Mississippi, sweet gum.	Utah, Utah white pine.
Louisiana, Bull bay magnolia.	Nevada, mountain mahogany.
Texas, pecan.	Idaho, Douglas spruce.
Arkansas, red oak.	Washington, canoe cedar.
Indian Territory, bois d'arc.	Oregon, sugar pine.
Tennessee, whitewood.	California, redwood.

The selection of representative trees is a matter of considerable care. Mr. Fernow has evidently undertaken to avoid repetition as much as possible, and when a wood might be chosen by several States as a representative one he has sought to determine which State was pre-eminently entitled to be represented by it, as for example the allotting of white pine to Maine, the former white pine State. Some of the closer details of the building have not been fully worked out, and it has been suggested that each of the several entrances might be finished artistically to represent the woods of a State or region, similarly to the plan decided upon as to the main entrance. Several lumber associations have made inquiry on this subject, and it is believed that each entrance could be very tastefully and appropriately made to represent different lumber sections or interests. With regard to the colonnade fronting the lake, it is thought probable that it will be utilized for an elegant café, and made to form one of the most attractive resorts on the grounds. The statement has been published that the roof of the building would consist of a thatch of straw. On the contrary it will be thatched with tanbark or other similarly appropriate articles. Other rustic exterior details will be fittingly worked out. The procession of flag staffs surmounting the outward portion of the roof suggests a tentative plan to have the woods of all countries indicated by the flags thereof. Each staff will probably fly a national streamer, accompained by state emblems or foreign colors, the whole constituting a very pretty and suggestive display. The frontage of the building, as shown in the engraving, is that facing the lake, the structure at the north end being the dairy building.

THE WORLD'S FAIR LUMBER AND FORESTRY BUILDING.

EXPOSITION NOTES.

The party which, under the direction of Chief Putnum of the department of Ethnology, of the Exposition, has been making excavations of the mounds in Ohio for three months or more, met with rare success on November 14th near Chillicothe, in making one of the richest finds of the century in the way of prehistoric remains. While at work on a mound 500 feet long, 200 feet wide and 28 feet high, the excavators found near the center of the mound, at a depth of 14 feet, the massive skeleton of a man incased in copper armor. The head was covered by an oval-shaped copper cap; the jaws had copper mouldings; the arms were dressed in copper, while copper plates covered the chest and stomach, and on each side of the head, on protruding sticks, were wooden antlers ornamented with copper. The mouth was stuffed with genuine pearls of immense size, but much decayed. Around the neck was a necklace of bear's teeth, set with pearls. At the side of this skeleton was a female skeleton, the two being supposed to be those of man and wife. It is estimated that the bodies were buried fully 600 years ago. The excavators believe they have at last found the king of the mound builders.

Prof. Dyche, of the Kansas University, one of the finest taxidermists in America, is preparing a notable exhibit consisting of about 150 of the largest mammals in the United States, including buffalo, elk, moose, antelope, deer, mountain sheep and goats, wild cats, wolves, bears, etc., etc. The different species of each are represented and almost all of the animals have already been secured.

IN WINTER WEATHER,

Which is dreaded by many people, there is nothing to excite alarm as to health and sickness. The Norsemen, Saxons and Normans in the early history of our ancestry and the Pilgrims and Puritans of New England in the colonial days contended with a worse climate and more uncomfortable conditions, but, nevertheless, were robust and vigorous to a remarkable degree. The coughs, colds and rheumatisms that are charged to the account of winter do not belong there. They are, nine times out of ten, the penalty paid by the sufferer for neglect, carelessness or wilful disregard of nature's laws. Winter, far from bringing pain and ailment, should be the bearer of those splendid physical pleasures which come from free circulation of the blood, a hearty appetite and active, intense exercise. To enjoy perfect health in the winter, and thus to be free from all respiratory and muscular troubles, is a very simple thing to anyone who will follow the precautions laid down by medical science. In the first place, the skin should be kept clean and the pores open. This is best done by a warm bath every day in which a little ammonia or borax has been dissolved in the water. Don't fall into the error so common in England of taking a cold plunge or cold shower. The nervous shock produced does no good to a strong person, and is dangerous, if not injurious, to a weak one. In certain diseases shocks by alternating suddenly the temperature of air or water in contact with the human body are of great benefit, but nearly all other occasions are of more harm than good. A warm bath, with a little ammonia and a soft Turkish towel are the best possible ministers of health. In the second place, do not use too much clothing nor overheavy clothing. The best possible winter suit is the Chinese system of three layers of woolen cloth and two layers of paper. This does not interfere with perspiration and does not allow any sudden change in temperature. Heavy winter coats and overcoats are a snare and a delusion. They superheat the body and produce ten times as many colds as they prevent. The ideal winter apparel in temperate latitudes consists of an undersuit of fine woolen and an outer suit of finely woven cloth with a thin overcoat. This allows a free movement to the transpiration, and, at the same time, keeps the body surrounded with warm air. In the third place, the system must be kept free from all humors and impurities and the vital organs must be in a condition of health and normal activity. This can best be achieved by the regular use of Ayer's Sarsaparilla whenever the organization has fallen below its proper tone. Other remedies may be good in their way, but only this one combines the power of expelling humors on the one hand and invigorating the organic functions on the other. A combination of Honduras sarsaparilla and other alteratives, it exercises the beneficent virtues of all its elements. By cleansing the circulation of all impurities, by stimulating the pancreas, stomach, liver and kidneys, and, above all, by strengthening the great lymphatic system, it changes a person's physical condition from weakness and liability to coughs, colds, rheumatism, neuralgia and sick headache to strength, buoyancy and royal good spirits. When it has once cleansed the organization and the working tissues, when it has restored the vital functions to their proper activity and power, all the ailments charged to drafts, extreme cold, rain and wet become absolutely unknown. Of course it is needless to remark that complete health cannot be secured by the use of Ayer's Sarsaparilla alone. With it there must be cleanliness, proper clothing and a due regard for nature's laws. But thus accompanied, health is an absolute certainty, and its happy possessor can pass through any winter, no matter if it be in the Arctic circle, and never suffer from the ailments so common to those who live from day to day without a thought as to their physical well-being.

BUSINESS NOTES.

A GREAT BATTLE SHIP.

AMERICAN CHAMPAGNE AT THE LAUNCH OF THE MONTEREY.

Irving M. Scott of the Union Iron Works shows himself to be enthusiastic in his State pride and patriotism. By his genius and hard work the great Iron works under his charge have been developed until they can not only compete with the great factories of the East, but can underbid them. Several great vessels for the United States Navy have been built at the Union Iron Works, and all are eminently satisfactory. An event that happened recently indicates Mr. Scott's fidelity to his State. When the great coast defense vessel, the Monterey, was about to be launched, Mr. Scott was besieged by the irrepressible agents of wines, each one anxious to have the kind he sells used at the launch. To a purveyor of French Champagne Mr. Scott sent the following characteristic and brilliant note in response to a request to use a particular kind of foreign wine at the launch: *Gentlemen:* Your letter of April 24th is at hand. We notice that you say that great men like Chauncey M. Depew, Andrew Carnegie, Cornelius N. Bliss, members of the Cabinet, Senators and others, only use a certain French champagne. While it would give me great pleasure to have them continue the old diet, the new dispensation and law of progress requires everyone to make a change, especially if it is for the better, and I would like to say that such distinguished gentlemen as honor me with a visit will drink only the royal wines of California, made from the pure juice of the grape, and as its name indicates, Eclipses all other brands. My patriotism and loyalty to my State, and my faith in the McKinley bill, all require me to use California prod-

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

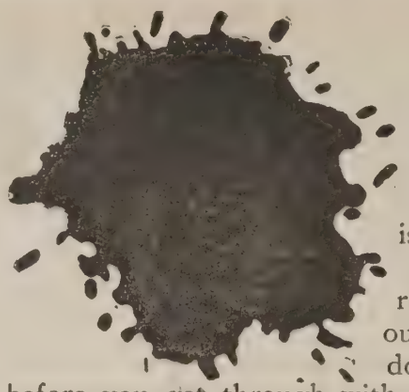
BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. COODE, Proprietor, Buffalo Lithia Springs, Va.



☞ Please mention the AMERICAN ANALYST.

ucts on every occasion, and the great battle-ship to-morrow will be christened by the product of our soil, as she herself is the work of our own mechanics' hands. Yours truly,

IRVING M. SCOTT,
Union Iron Works.

NOT WHOLLY DESIRABLE.—Electrician Nikola Tesla says the time will soon come when a ship will be able to telegraph to either shore of the sea she is traversing without cable or indeed any direct connection. This will deprive ocean voyaging of one of its chief advantages to many tourists.

RAIN-MAKING EXPERIMENTS.—A letter from a citizen of Texas who witnessed the recent Dyrenforth rain-making experiments in that State pronounces them the most veritable humbugs and absurd waste of public money of which it is possible to conceive. He says that the trial party were shrewd enough not to begin operations before the season when, from time immemorial, rain has come down plenty and often in that region. In his belief, too, unwarranted claims and representations were sent out as to the results of the experiments.—*Boston Journal.*

The Dearest Spot on Earth

is the spot that's washed out *without Pearline*. It costs in clothes, in the rubbing and scrubbing that wears them out quickly; it takes twice the time, and double the labor. It's expensive washing before you get through with it—and the cost comes home to *you*, no matter who does the work.

Pearline saves money by saving work, wear, and time. It hurts nothing; washes and cleans everything. It costs no more than common soap, but it does more. It's cheap to begin with—but it's cheapest in the end.

Beware of imitations of PEARLINE which are being peddled from door to door.

106 JAMES PYLE, New York.

UNEXPECTED RESULT.—"There," he said fondly, "just to show you how much I thought of you I took your picture with my new instantaneous camera. Here it is." "Do you think it looks like me?" she inquired, almost tearfully. "Why–er–yes, of course." "Then all is over. I cannot be yours. It must be my money and not myself that you seek."

THE COLUMBIA DAILY CALENDAR.—An old friend in a new dress, and an article that has come to be one of the indispensables of an editor's desk, comes to hand in the Columbia Daily Calendar for 1892. The calendar is in the form of a pad containing 367 leaves, each 5½ x 2⅝ inches; and each slip bears a short paragraph pertaining to cycling or some kindred subject, and at the bottom of each leaf is a blank for memoranda. The stand is an entirely new departure, being made of sheet metal finished in ivory black, and is very compact. This is the seventh issue of this now well-known calendar, yet all the matter is fresh and new.

LARGE PANES OF GLASS.—The largest plate of glass in this city and in the State is in the Eleventh Street window of Robert J. Thompson, at the southwest corner of Eleventh and Chestnut Streets. The size of the plate is 8 feet 4 inches by 16 feet 8 inches, and it was manufactured at Kokomo, Ind. The firm which had the contract for furnishing the glass first placed its order with a Pittsburg Company, which was unfortunate enough to break two plates of that size in preparing them for transportation. There are several others which nearly equal this one in size. There is one 194 by 100 inches, another 140 by 144, and one which was recently replaced, an infuriated bull having gone through its 198 by 98 inches. The largest plate of glass in the country is in stock at Kokomo, and is 16 feet 8 inches, by 11 feet 8 inches.—*Philadelphia Record.*

Happy and content is a home with "The Rochester; a lamp with the light of the morning. Catalogues, write Rochester Lamp Co., New York.

Armour's

Extract of BEEF.

The best and most economical "Stock" for Soups, Etc.

One pound equals forty-five pounds of prime lean Beef.

Send to us for our book of receipts, showing use of **ARMOUR'S EXTRACT** in Soups and Sauces.

ARMOUR & CO., Chicago.

INDIAN RAIN-MAKERS.—They are beginning to have faith in the efficacy of rain-making expedients in Upper Burmah. Rain has been badly needed there. A while ago Lieut. Pilcher was ordered to ascend a hill 1,300 feet high and fire off two heavy charges of gun cotton of thirty and forty pounds each. The sky had been cloudless before, but the explosions were followed by gathering clouds and a copious fall of rain. The people there are convinced that there is abundant rain in Upper Burmah if it can only be shaken out.

Cleveland's Baking Powder

Does not contain ammonia;
Costs no more than ammonia powders;
It goes farther;
It is pure and wholesome.

You should use it.

Fine Table Wines

From our Celebrated Orleans Vineyard.

O V Sauterne, with the exact character and *Seve* of imported Sauternes.

The **Chateau d'Orleans** and **O V Chablis** are sold in glass only.

"Seeing is Believing."

And a good lamp must be simple; when it is not simple it is not good. *Simple, Beautiful, Good*—these words mean much, but to see "The Rochester" will impress the truth more forcibly. All metal, tough and seamless, and made in three pieces only, it is *absolutely safe* and *unbreakable*. Like Aladdin's of old, it is indeed a "wonderful lamp," for its marvelous light is purer and brighter than gas light, softer than electric light and more cheerful than either.

Look for this stamp—THE ROCHESTER. If the lamp dealer has n't the **genuine** Rochester, and the style you want, send to us for our new illustrated catalogue, and we will send you a lamp safely by express—your choice of over **2,000** varieties from the *Largest Lamp Store in the World.*

ROCHESTER LAMP CO., 42 Park Place, New York City.

"The Rochester."

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

FOR THE SPEEDY RELIEF OF

NERVOUS HEADACHE AND BRAIN FATIGUE.

WARNER & CO.'S EFFERVESCING

Useful in Nervous Headache, Sleeplessness, Excessive Study, Over Brainwork, Nervous Debility, Mania, etc.

DOSE.—A heaping teaspoonful in half a glass of water, to be repeated once after an interval of thirty minutes, if necessary. Each teaspoonful contains 30 grs. Bromide Sodium and 1 gr. Caffein.

It is claimed by some prominent specialists in nervous diseases that the Sodium Salt is more acceptable to the stomach than the Bromide Potassium. An almost certain relief is given by the administration of this Effervescing Salt. It is also used with advantage in INDIGESTION, DEPRESSION following alcoholic and other excesses, as well as NERVOUS HEADACHE. It affords speedy relief for MENTAL and PHYSICAL EXHAUSTION.

INVENTIONS OF THE FUTURE.

In a recent newspaper interview Mr. Thomas A. Edison, in response to the query whether the inventions of the next fifty years will equal those of the past fifty years, replied: "I see no reason why they should not. It seems to me that we are at the beginning of inventions. We are discovering new principles, new powers, and new materials every day, and no one can predict the possibilities of the future. Take electricity. When we get electricity directly from coal, a lump as big as this tumbler will light and heat a whole house for hours, and a basketful would run a factory a whole day. In the generation of steam we only get 14 per cent. of the energy of the coal. In electricity we get 96 per cent. When we get electrical power direct from coal a few hundred pounds will carry you across the Atlantic and a few basketfuls will take a railroad train from New York to San Francisco. I believe this to be one of the great problems of the future, and I have no doubt but that it will be solved. I have been working on it for years, but I haven't got it yet. When it does come it will revolutionize everything. It will cheapen everything, and it will be the greatest invention of modern times. As it is now we have to burn the coal to get the steam, and the steam gives us the power which runs the dynamo and produces the electricity. We have by no means reached the perfection of the telephone," Mr. Edison went on. "Improvements are being made all the time, and the day will come when every one will have his telephone. Long distance telephoning is growing, and the only restrictions of the possibilities of the telephone is in the sympathetic contact of the electrical wire with the rest of nature. If the single wire could be placed so high above the earth that it would not touch the mountain tops, you could whisper around the world and you could sing a song in London and have it heard in Pekin. Wherever we get the wire comparatively free from contact with the earth, distance seems to make no difference, and on a government line 1,000 miles long over a treeless country in Arizona we got a better telephonic connection than we do now between New York and Philadelphia. If we could have a telephone from the earth to the sun—I mean a wire—we could send sounds there with perfect ease; and with the phonograph, were our language universal, we could make a speech here and have it recorded and reproduced in any of the great planetary bodies."

THE SECOND FOOD EXPOSITION.

We are informed by the management that the preparations for the coming Food and Health Exposition at the Lenox Lyceum by the Retail Grocers' Union have so far advanced as to insure the complete success of that undertaking. The purpose of the management is to make the exposition precisely what it is announced to be and to avoid the exhibits which would not be entirely in keeping with the general purpose of bringing to the favorable attention of the public articles of pure and wholesome food. When publication was first made that a second exposition would be held the officers of the union were overrun with applications from all kinds of people who wished to make exhibits. It was necessary at the outset to determine upon a policy of exclusion, but in the absence of a manager who could be firm and could insist strictly upon this policy regardless of personal feeling, some exhibitors were allowed to believe that they might show their goods at the Lenox Lyceum who really had no business at a food and health show. The management of the exposition this year will differ essentially from that of last year in that no pecuniary gain or compensation can accrue to the manager himself. All that he can get from the exposition will be the credit of having shown to the public a fine display of food products and of pleasing the exhibitors of those products by furnishing them with good company in the exposition. His energies are devoted to this end, and he means to win from those who have entrusted him with the management and with those who may be under his supervision during the exposition a verdict of having done what he promised. Exhibitors promise that the attractions at the coming show will be in no case inferior and in many respects superior to those of last year, and the policy of exclusion will be rigidly applied so as to insure an expositiom that shall be actually one of food and health products.

PRACTICAL PHILANTHROPY.

There was opened on December 21st in Hudson street, in this city, a "New England Kitchen," which, although not exactly a charitable institution, is to be conducted with a view to helping the poor and those who have not the means to cook properly and prepare food. There will be no restaurant in connection with the kitchen, but well-cooked food will be sent out to families desiring it at extremely low prices, thus making the institution self-supporting. Only such food as requires long cooking and which does not lose its nicety of flavor by being kept hot through the day, will be offered for sale. Soups and stews, chowders, beef in various forms, cereals, baked beans, brown bread, and puddings will be among the products offered. Factories and stores, where people work long hours and are not able to get hot lunches at noon, will also be supplied. The food will be prepared by the method advocated by Mr. Edward Atkinson of Boston, who delivered lectures on the subject last Spring at Columbia College. The kitchen will supply vegetable soup at 8 cents a pint, fish chowder at ten cents, pressed beef at 20 cents a pound, cracked wheat at 5 cents a pound, baked beans at 14 cents a quart, bread at 5 cents a loaf, and other things at corresponding prices. The establishment of the present kitchen is due to the exertions of Dr. Thomas Egleston of the Columbia School of Mines. It is the third one started in this country. Two established at Boston under the supervision of Mrs. Ellen H. Richard of the Institute of Technology of that city have had great success.

PROPOSED CHANGE.—Secretary Rusk announces that beginning January 1 the weather forecasts will "in each case cover the time until midnight of the next day," so that "the predictions printed in the morning papers will appear early in the day to which they apply, while those in the evening paper will be for the day after. The public will be informed on the evening before of the expected weather and will be given an improved forecast the next morning if improvement is needed. The forecasters are also encouraged to predict for the second or third day in advance."

READ PAGE 629.

EXPLOSIONS AND RAIN.

SOME CONJECTURES ON A YET UNDETERMINED PROBLEM.

A question still in suspense, and in regard to which no decisive conclusion has been reached, is that of the possible connections between explosions and rainfalls. Observations alternate, for or against. If on one side numerous and very exact coincidences have been remarked, on the other side are recorded many cases in which explosions appeared to have no effect on clouds or mist. From all the experiments can be drawn, at least one conclusion, that the agitation of the air provokes condensation under favorable circumstances only. As I have heretofore remarked, this important question cannot be solved, save by registering with the utmost care all the circumstances which accompany each experiment—temperature, nature of the clouds, nature of the explosions, interval between the first explosion and the beginning of the rain, the extent and duration of the latter. Let me mention two recent observations. Of these the first was communicated by Mr. W. R. Pidgeon to the excellent English review, *Nature:* "On the first of October, at five o'clock in the evening, in the quarries of Penryhn, a great quantity of useless stone was cleared away by a single explosion of five tons of powder. During the entire day a violent wind had been blowing, and the clouds, while heavy, were high, there had been no rain and little sun, and the temperature was quite low. Immediately after the explosion the wind lulled, there was an absolute calm for five or six minutes, and, twenty minutes after, a fine rain began to fall, which became gradually harder and did not stop for an hour and a half. At seven o'clock all the perturbations caused by the explosion had apparently ceased, and the weather became like what it had been all day. The rain was wholly local and did not extend more than six or seven miles from the quarry." The second observation was communicated to me by one of our readers in Bordeaux: "An explosion of gun-cotton took place, about a month ago, at a powder mill in the suburbs of the city. The explosion was felt at a great distance. The sky was cloudy that day, but without rain. Three minutes after the powder went off abundant rain fell." Of course, while admitting that these narratives are exactly true, it is not disrespectful to keep in mind the well-known story of the Academicians and the fish of Frederick II.—a story told with several variations, of which the following is one: A physicist had some friends to breakfast. When the cigars were passed round the company went out and smoked them in the garden. One of the guests, placing his hand accidentally on a glass globe covered with silver foil, remarked, with surprise, that it was warmer on the shady side than on that on which the rays of the sun fell. The savans put their heads together to examine and discuss this singular phenomenon. Plausible reasons were not lacking, but it was finally decided that none of these reasons were satisfactory. They were about to declare that the matter was inexplicable. when the gardener, guessing what they were talking about, approached the group and said: "Gentlemen, I am the cause of the difficulty, for I have just turned the globe round." Examples of this kind multiply. I will try to show one way in which can be explained the action of shocks of the air upon the condensation of watery vapor. I remarked, in the first place, that the effect of an explosion can be perceived at a great distance without any warning to the ear. The great instance of Krakatau will remain memorable. It has not been forgotten that the wave of compression produced by this formidable perturbation was perceived at Paris by a disturbance of the barometer, which was twice manifested, first, for the shortest passage of the wave, and then, some hours afterwards, for the passage over the other part of the great circle passing through Paris and Krakatau. In the next place, we know, by the admirable experiments of Messrs. Aitken and de R. von Helmholtz, that the air can be saturated to excess with vapor, notably if it be thoroughly free from dust; but as soon as the smallest drop forms it enlarges in the twinkling of an eye, and the equilibrium, before unstable, becomes stable by the sudden condensation of all the vapor which has passed beyond the state of saturation. This experiment confirms in a striking manner the theorem demonstrated intuitively by Sir William Thomson, that the tension of vapor in the vicinity of a liquid depends on the superficial curve of the latter. What is wanted by the perturbation of the air is not to produce a working power, but only to start the thing after the fashion of the train of powder which makes a cartridge explode. We know, by the classic experiment of the pneumatic tinder-box, that a compression of the air produces an elevation of the temperature, while an expansion of the air has the effect of cooling the temperature. Assuredly, the variations of temperature caused by an explosion are slight, but nothing prevents our admitting that the cooling is sufficient to cause the saturation to go beyond the point at which it can be held by the air. Dew is formed in some place by the wave of expansion, and the rupture of equilibrium thus begun is bound to increase. This hypothesis is not the only one that can be made. In all hypotheses account must be taken of the fact that explosions act very unequally. When the action of dust can be perceived, as in the case of explosions separated from the smoke in the midst of the surrounding air in unstable equilibrium, the effect, confirmed by the experiments of the laboratory, is undeniable; but in most cases it is impossible to admit that the dust has acted, and we are obliged to explain this rain by the agitation of the air. It is very difficult to appreciate the efficiency of the different actions which can be attributed to this agitation. As I said at the beginning, exact observations are indispensable. I think I have shown that it is not a waste of time to make experiments, if they are made without the experimenter having made up his mind one way or other. Let us hope that in a few years the question of whether explosions can produce rain will be resolved in the affirmative or be finally buried.—*La Nature.*

FREEZING AND FAILURE.

A CURIOUS EXPERIMENT IN FOOD PRESERVATION.

It has long been known that the most perishable kinds of food can be preserved for long periods by freezing. In the Arctic regions, where the natural temperature favors such a course, freezing is relied on to preserve meat for months at a time. The introduction of artificial freezing processes has caused freezing to be utilized in our own more southern latitudes with greater or less success for the same object. A test of the question of food preservation by the above means was recently brought to a striking conclusion. A few days ago, Mr. Edward R. Bell gave a dinner at his residence in this city. As guests there were present Rev. Morgan Dix, D. D., Rev. Halsey Knapp and some other friends. The primal object of the gathering was to test the palatability of a turkey which had been killed ten years ago, and which had been kept frozen ever since. Mr. Knapp had been the custodian of the bird during all those years. The turkey was prepared as a part of the dinner. It was found that the fowl was perfect in shape, and without taint of any sort, but its meat was utterly tasteless and void of all the flavor and juices proper to a well roasted turkey. The fat and juices had entirely disappeared, leaving, only bone and muscular fiber. The prevailing impression as to the inferiority of frozen food products was fully borne out by this interesting experiment. It is known that freezing impairs the flavor of meats, fish, and vegetables, and while it arrests decomposition it does not entirely prevent evaporation and desiccation. Housekeepers who are particular about providing the best beef, fowls, and provisions in general for their tables are very apt to avoid the purchase of any products which have been frozen. For reasonable periods food is kept by cold without freezing, and this is virtually the action of our domestic refrigerators. Absolute freezing with preservation through one or two seasons is not to be commended. —*Scientific American.*

DOMESTIC DIETETICS.

SPECIALLY PREPARED, FROM PRACTICAL TESTS, FOR THE LADY READERS OF THE "AMERICAN ANALYST."

SEASONABLE FOOD.

December.

MEATS.—Beef, mutton, pork, venison, veal.

POULTRY AND GAME.—Chickens, fowls, duck, geese, turkeys, grouse, capons, hare, partridge, pheasants, rabbits, pea-fowls, guinea-fowl, snipe, widgeon, wild ducks, woodcock.

FISH.—Brill, carp, cod, crabs, perch, salmon, smelts, soles, sprats, tench, turbot, whiting, halibut, sturgeon, oysters.

PRACTICAL RECIPES.

MEAT BALLS, WITH WALNUT SAUCE.—Chop fine together half a pound of meat, an onion, parsley, allspice and thyme, and a small quantity of bread-crumbs, two well-beaten eggs, and a little flour to bind them. Make this into balls and fry. Cut in halves four or five English pickled walnuts; place them in a pan on the fire in diluted vinegar; when this is boiling put in the balls, already fried, and then let them simmer for about a quarter of an hour or a little less. Serve hot, with hard boiled eggs cut up, placed around the dish, and parsley to garnish.

BAKED HASHED VEGETABLES.—Take equal quantities of rich vegetables, as carrots, potatoes, beets, cabbages, turnips, etc., which have been parboiled, chop them up and season them highly with pepper and salt, a dash of grated nutmeg, mace, and a little minced lemon peel. Mix all thoroughly, and put it into a buttered pie-dish. Cover with one well-beaten egg, or with finely grated bread-crumbs, and put it into the oven to bake.

FRENCH PIE.—Chop very fine any left-over cold meat, season it highly, moisten it well with gravy, and beat thoroughly; put it in a deep pie-plate, heap mashed potatoes over it, put little bits of butter over the top, and brown in the oven.

CHEESE TOAST.—Toast very brown and crisp some thin slices of bread; grate and slice some cheese and put in the oven in a buttered baking-dish; watch carefully, and when it begins to dissolve stir some butter and a dash of cayenne pepper into it; pour it on the toast and serve at once.

GELATINE CREAM.—Soak three tablespoonfuls of gelatine in two cupfuls of water; when it is soft, put it on the stove, and when it comes to the boil add three tablespoonfuls of sugar, and three well-beaten egg yolks. Take from the fire, beat for a few minutes, and then add the egg whites, well beaten, and a pinch of salt; flavor with vanilla; pour into wet moulds and set away to harden; serve with custard or cream.

WHITE GINGERBREAD.—Half a pound butter, half a pound sugar, one pound flour, grated rind of a fresh lemon, one ounce ground ginger, a grated nutmeg, half cupful sweet milk and a small teaspoonful of soda; mix together the sugar, flour, lemon, spices, and rub the butter into them; warm the milk, dissolve the soda in it, add it to the rest of the ingredients, roll out, cut into square cakes and bake.

APPLE PANCAKES.—One quart milk, three eggs, a little salt, flour, one dozen large apples; make a batter of the milk, eggs, flour and salt; pare, core and chop the apples, add them to the butter, fry in butter, and eat with powdered sugar. If they are not light enough, add one teaspoonful baking powder.

FRUIT BREAD PUDDING.—Make a bread pudding; bake it in a stone dish about half full; when nearly done draw it to the oven door, put a layer of fruit over it and put it back again to bake. When done make a meringue of the whites of three eggs and a little sugar, brown slightly and serve.

LEEK AND POTATO SOUP.—Fry a bunch of leeks in butter until brown; season them with pepper and salt, and pour over them three pints of boiling water; let them simmer for half an hour; add four fine large raw potatoes cut into slices, and boil until the potatoes are soft. Press through a sieve, beat up again, add one pint of boiling cream or one pint of boiling milk, and a lump of butter, and serve.

CHRISTMAS CAKES —Beat till very light one pound of powdered sugar with four eggs; then add one pound of sifted flour. Roll out on a pie-board, sprinkle with aniseed, cut into fancy shapes, and bake in a medium hot oven.

RUBBER FOOT FEVER.—If a man has a corn, says the *India Rubber World*, it can be removed, but if he is suffering from rubber foot fever, no chiropodist can help him, and the only thing to prescribe is liberal bathing of the feet and removal of the cause. Rubbers should only be worn to keep wet out, and the should be removed the moment the wearer gets indoors. Failure to note this gives a man wet feet in a far worse sense than if he waded through mud ankle deep. It was the trouble resulting from forcing the perspiration to soak the stockings and keep the feet perpetually damp that drove rubber-soled boots out of the market. Even loose rubbers are a source of danger and the cause of many more serious colds than they avert.

ANNIHILATING SPACE.

REPORTING AND TYPE-SETTING BY TELEPHONE.

One of the most useful and unique accounts to which the telephone has ever been turned is that adopted by the management of the London *Times*. Wires have been laid in an underground railway tunnel between the *Times* composing room in Printing House Square and the Parliamentary reporter's gallery in the House of Commons. A copy reader is placed at each 'phone and he reads the stenographic "turns" from the note-book as fast as it is possible for the compositors to take them on type-setting machines over in the *Times* building, a mile and a half away. The hearing apparatus is fastened to the ear of the compositor in the same manner as our "Central" telephone offices, and the reader himself must constantly listen for the interruptions and necessary repetitions. The uproar in the regular reporters' room in the House has driven a great many of the readers into other parts of the building. Hence, upon almost any night during the session of Parliament, one may witness the novel spectacle of dual debates in and out of the chamber—the "M. P.'s" and the readers—and it is no hyperbole to say that the elocutionary odds are in favor of the latter. At first the reporters did not approve of the innovation, but when the *Times* men found they could dictate their notes through to the composing room without the labor of transcribing them they quickly availed themselves of the opportunity, though, as a matter of necessity, they receive proofs for correction. Each machine can produce from five to six columns of sold minion a night. Of course errors creep in, but on the whole the scheme works well; and the fact that it enables the *Times* to print in time for the 5 A. M. newspaper trains going to all points of the United Kingdom the whole of debates that are often continued until after 3 A. M. is an earnest of the plans permanancy.

BUSINESS NOTES.

HORSFORD'S ACID PHOSPHATE

For abuse of alcohol. It relieves the depression therefrom. Dr. W. Graeves, Northfield, Minn., says: "I have used it in cases of nervous prostration, and also in combination with other remedies in indigestion, it has proved as satisfactory as could be expected.

SHADE ROLLERS.

Any one who remembers the old-fashioned shade rollers cannot help but feel thankful to Stewart Hartshorn that he invented the self-acting pawl for spring shade-rollers in 1864. This invention revolutionized the shade trade. Although spring shade rollers are now universally used, their introduction was slow, expensive, laborious and discouraging work. How few people who use these shade rollers have any idea of the manifold operations necessary to produce one of these rollers in perfection, of the variety of sources whence the materials from which they are made are drawn, or of the magnitude of the manufactories in which they are prepared. The extensive white pine forests of Michigan, Wisconsin and Canada supply the roller wood. The iron comes from several different States. The spring wire is drawn from steel rods made in England. The hard wood that forms the centre of every spring is brought from Pennsylvania. Copper from Lake Superior and zinc from New Jersey compound the brass that is both ornamental and useful. All these materials are put together in several many-storied factories, each covering large plots of ground, and convenient to wharfage in East Newark, Muskegon and Toronto. In a future number we will endeavor to show how this business has grown from small beginnings to its present magnitude. The moral is: Make what the people want, keep up quality, and have a fair price, you will succeed.

BUFFALO LITHIA WATER

For BRIGHT'S DISEASE OF THE KIDNEYS, THE GOUTY DIATHESIS, Etc.

Dr. WM. A. HAMMOND'S Sanitarium for Treatment of Diseases of Nervous System, 14th Street and Sheridan Avenue, Washington, D. C.

Dr. WM. A. HAMMOND,

WASHINGTON, D. C.,

Surgeon-General U. S. Army (retired), formerly Professor of Diseases of the Mind and Nervous System in the University of New York, etc., says:

"I have for some time made use of the

BUFFALO LITHIA WATER

in cases of affections of the Nervous System, complicated with Bright's Disease of the Kidneys, or with a Gouty Diathesis. The results have been eminently satisfactory. Lithia has for many years been a favorite with me in like cases, but the

BUFFALO LITHIA WATER ACTS BETTER THAN ANY EXTEMPORANEOUS SOLUTION

of the Lithia salts, and is, moreover, better borne by the stomach. I also often prescribe it in those cases of cerebral hyperæmia, resulting from over mental work—in which the condition called nervous dyspepsia exists—and generally with marked benefit."

WATER IN CASES OF ONE DOZEN HALF GALLON BOTTLES, $5.00, F. O. B. HERE.

☞ For sale by all first-class Druggists, and Pamphlet sent to any address.

THOMAS F. GOODE, Proprietor, Buffalo Lithia Springs, Va.

☞ Please mention the AMERICAN ANALYST.

A Tonic

Horsford's Acid Phosphate.

A most excellent and agreeable tonic and appetizer. It nourishes and invigorates the tired brain and body, imparts renewed energy and vitality, and enlivens the functions.

Dr. EPHRAIM BATEMAN, Cedarville, N. J., sasy :

"I have used it for several years, not only in my practice, but in my own individual case, and consider it under all circumstances one of the best nerve tonics that we possess. For mental exhaustion or overwork it gives renewed strength and vigor to the entire system."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION:—Be sure the word "Horsford's" is on the label. All others are spurious. Never sold in bulk.

ENGINEER AND SAILOR.—If the blue jacket is to be superseded to a very large extent, as now seems likely, by the machinist, then the navigating officer must needs learn to handle machinery or be displaced by an engineer who has learned navigation and gunnery. For the modern war ship has come to be a machine, or, rather, a collection of machines ; her masts, if she have any, of the "military" type, with no yards across and barren of sails, topped only with nests for observation and light batteries. To place such a craft under the command of a sailor is like putting a sailing ship in command of a machinist.

It's concealed,
but it's there—
ammonia in baking powder
widely advertised as
"absolutely pure ;"
'tis easy to detect it ;

Boil up a heaping spoonful of the powder in a spoonful of water, and smell the steam.

There's nothing to conceal in Cleveland's baking powder; the composition is stated on every label.

The ingredients are all so wholesome we are glad to have people know what they are.

Girls.

BY HELEN EKIN STARRETT, IN *The Forum.*

"Thousands who are now in shops and other organized industries would really prefer work in homes, if only the heavy, grimy, malodorous, *clothes-destroying* work of cooking and laundering were not required and expected of them."

Well—if this is true there's a good time coming for girls and the mistress too ; for women (by millions) are coming to know, that *Pearline* saves the clothes on your back as well as the clothes in the wash ; the paint on your walls—the sheen of silver—the lustre of glass and reduces the labor—drudgery—health breaking—temper and comfort wearing work of washing and cleaning to almost nothing.

Besides—the girl—the mistress—or both—are better satisfied with the results. It cleanses—restores original colors—but hurts nothing, not even delicate skin—luxurious for bathing—be among the bright ones and use *Pearline.*

Beware Peddlers and some unscrupulous grocers will tell you, "this is as good as" or "the same as Pearline." IT'S FALSE—Pearline is never peddled, and if your grocer sends you something in place of Pearline, do the honest thing—*send it back.* 192 JAMES PYLE, New York.

HOARDED TREASURES.—It is estimated that the treasure lying idle in India in the shape of hoards or ornaments amount to $1,250,000,000. A competent authority calculates that in Amrista City alone there are jewels to the value of $10,000,000.

CLAIRVOYANCE.—A girl in Dexter, Me., possesses a faculty which mystifies her friends. When blindfolded and provided with a photograph she can describe the person or object portrayed in the picture, and she will also describe the objects in any picture or print after merely running her finger tips over the surface.

INDIA TEA.—The Chinese tea trade has been greatly injured in recent times by the increase in the use of Ceylon tea in various countries of the world. It is estimated that 100,000,000 of the Chinese people are engaged in the culture, preparation, sale, carriage and exportation of tea, and are adversely affected by the rivalry of other countries.

ABORIGINAL SKULLS.—At the Indian School in Carlisle, Pa., Dr. Boas, the ethnologist, is measuring and examining the red skinned students in order to get their cranial and facial form. Their ears are large, their cheek bones heavy, their eyes small, and their brain of good size. The results of his investigation will be sent to the Smithsonian Institute in Washington.

COLOR OF OXYGEN.—Till recently oxygen was believed to be as colorless in the liquid as in the gaseous form. But the Polish chemist, Olszewski, shows that it is only because thin layers of it have been examined that liquid oxygen has been believed to be colorless. He has succeeded in getting a layer of it 30 millimeters thick, and he finds that it has a bright sky-blue color. The discovery is very important in point of view of the absorption spectrum of oxygen.

THE MOLASSES PROBLEM.—The undivided attention that is now required of every sugar planter to enable him to successfully harvest the present cane crop is diverting attention from the question involved in the caption of this article. It will come up again at the end of the season with as great a force as ever, and it would seem well even now that it should have consideration and that every effort should be made to open up some new market for this large fraction of our sugar crop. There is now a practical loss of the entire value of the molasses to all vacuum pan houses.—*La. Planter.*

GRANT.

SHERMAN.

SHERIDAN.

McCLELLAN.

GEN. GRANT'S MEMOIRS.

Original $7 Edition for 30 Cents.

NO book, excepting the Bible, has ever had such a sale in the United States as General Grant's Memoirs. 650,000 copies have already gone into the homes of the rich, but the subscription price of $7.00 has placed it beyond the reach of people in moderate circumstances. **If 650,000 people have been willing to pay $7.00 for Grant's Memoirs, there must be a couple of million people in the United States who want them, and will jump at the opportunity** to buy them at the low figure here offered.

We will send you General Grant's Memoirs, publisher's original edition, best paper, cloth, green and gold binding, hitherto sold by subscription at $7.00,

FOR 30 CENTS!—FOR 30 CENTS!—ABSOLUTELY ONLY 30 CENTS!

and absolutely a proposition such as has never been made in the history of book publishing. The two splendid volumes of Grant's Memoirs, of which 650,000 copies have been already sold—not a cheap edition, but the best—for 30 cents; provided you send your subscription of $1.00 to the **AMERICAN ANALYST** one year, and also a subscription of $3.00 for the **COSMOPOLITAN MAGAZINE,** the brightest and cheapest of the great illustrated monthlies, itself equal to the best $4.00 magazine.

The **COSMOPOLITAN** is enabled to make this offer because of **the purchase of 600,000 volumes at a price which even publishers would deem impossible, and with the idea of running up its circulation to half a million copies.** By contract with the **COSMOPOLITAN,** and at no profit to us, we are enabled to offer our readers a share in the low price obtained through the largest purchase of books ever made in the history of the world.

If, however, you have Grant's books, our offer will permit you to take instead,

GEN. SHERMAN'S MEMOIRS, 2 Vols., sold by subscription for $5.00
GEN. SHERIDAN'S MEMOIRS, 2 Vols., sold by subscription for 6.00
GEN. McCLELLAN'S MEMOIRS, sold by subscription for . . 3.75

All of these are bound in cloth, green and gold, in uniform style with Grant's Memoirs.

Send us at once $3.00 for year's subscription to the **COSMOPOLITAN,** $1.00 for year's subscription to the **AMERICAN ANALYST,** and 30 cents for a set of Memoirs—$4.30 in all—to which add postage on the particular set of Memoirs selected.

WHY DO WE MAKE THESE GRAND OFFERS?

Simply because we want every intelligent family to keep well informed as to the popular science of this progressive era. We publish the **only popular journal on this subject—THE AMERICAN ANALYST.** Its subscription list is already very large; but we want at least **Fifty Thousand additional subscribers before January 1, 1892.** We know that, if we shall get them, we shall be able to hold most of them as permanent readers of our periodical. So at present sacrifice and at great cost, we have entered into a combination. The **COSMOPOLITAN** is the brightest and cheapest of the great illustrated monthly magazines; it gives annually 1,536 pages by the ablest writers, and over 1,200 illustrations by the ablest artists; and is just as interesting to the young boy or girl as to the oldest grey head. Now, then, we ask you to send us merely $4.30, and, on receipt of same, we will mail them to you regularly for **one year,** and will also send you making no charge for the books) a set of **GENERAL GRANT'S MEMOIRS,** or either of the other works that you may select. **NO SUCH OFFER AS THIS WAS EVER MADE BEFORE BY ANY PUBLISHER SINCE TIME BEGAN!**

UNLESS OTHERWISE DIRECTED,

we shall invariably ship the books by express, charges to be paid by the receiver. If you wish the volumes forwarded by mail, you must distinctly say so at the time when you send us your address and the Money; and you must also enclose postage to prepay the packages at the following rates: **GRANT'S MEMOIRS,** 96 ozs., 48c.; **SHERMAN'S MEMOIRS,** 92 ozs., 46c.; **SHERIDAN'S MEMOIRS,** 84 ozs., 42c.; **McCLELLAN'S MEMOIRS,** 48 ozs., 24c. The government rate for postage on books is one-half cent per ounce. The **COSMOPOLITAN** and **AMERICAN ANALYST** are sent to subscribers free of postage.

TABASCO PEPPER SAUCE,

OR LIQUID PEPPER.

Is simply the Pulp of the Ripe Pepper Extracted by Pressure.

The seed of this Pepper was obtained from Central America, and by careful cultivation in Louisiana for many years has been so improved in strength, flavor and aroma, as to have become a new variety of Red Pepper, superior to all others. The pulp is so handled as to retain all the flavor, strength, aroma and color of the ripe fruit, and to keep unimpaired in any climate. It excites the appetite, promotes digestion, and is pronounced by connoisseurs to be the finest condiment in the world. For medicinal purposes it recommends itself by its purity, strength and diffusible form.

AND

COMPOUND SYRUP OF HYPOPHOSPHITES

Cures Consumption, Bronchitis, Coughs, Colds, Scrofula, and all Wasting Diseases.

It is pleasant and palatable to take as honey. Does not produce Nausea, and is easily assimilated.

Its strengthening effects are almost immediate.

It does not come up to assert itself semi-occasionally after being swallowed, as other Emulsions certainly do.

It is a Great Producer of BONE and MUSCLE, it purifies the Blood, and patients gain rapidly in weight while taking it.

It is a true Emulsion, the only one that is always ready, always alike, and that never has a thick, gummy, and greasy blob at the top to upset the patient's stomach.

It is used in all the leading hospitals.

It is prescribed by the most eminent physicians in the United States and Canada, and many assert that it is

THE BEST EMULSION IN THE MARKET.

Ask your Druggist for it, AND TAKE NO OTHER.

ARROWHEAD HOT SPRINGS,

CALIFORNIA.

I MOST respectfully invite physicians of the East to write to me for information concerning this famous Southern California resort. The hot mineral water mud baths, and climate are unequalled in America. Diseases of the throat, lungs, liver, stomach and kidneys, nervous and skin troubles and rheumatism, are the ailments successfully treated. The hotel contains 125 rooms, is first-class, and lighted throughout with incandescent lights. Elevation 2,000 feet. Address,

H. C. ROYER, M. D.,

Arrowhead Springs, San Bernardino Co., California.
